In industry no doubt the first motive that ruled the making of things was the motive of use. Men made things because they could use them. The motive toward the making of an ax or a saw was the greater ease with which men could do their work, the greater results for the amount of energy expended. The initial motive of manufacture must always be that.

Commerce met manufacture and introduced another motive. The making of things became specialized and involved the necessity of selling things. Thus the profit motive arose. With the growth of specialized manufacture, the maker needed help; he called in others to work as he worked; he taught them the trade. In time his work became management altogether. The actual production was done by employes. The profit motive included a profit on other men's work, which in time led to complications. What was the right share for the employe? What was the right share for the man who created the opportunity, the method, the trade?

And all this has gone on developing in importance, bringing its full measure of fallacies with it, until today it is one of the "questions" which engage the world. We have what we call a working class, by which is meant an employed class. There are, of course, great multitudes of people who never will work for anyone but themselves; they are so constituted that employment by others is contrary to their natures. There are others, great multitudes, who would rather be employed than have the risks, responsibilities and extra hazards of being their own managers. People usually choose, according to their natures, which course they will take. Both courses are freely open to all. They are more open now, more various in their opportunities and choices, than they ever were before.

But it is usually around the employed class that the so-called "industrial question" revolves. When industry was centered upon the commodity made, or upon the market, or upon the profit, the interests of the workers were not specially looked after. But when interest was drawn off from the commodity and the market, and centered in the worker, the theory arose that he was the sole reason, the be-all and end-all, of industry. Everything existed for him.

One extreme does not correct another, it only changes the location of the difficulty. There is no single right in industry. The commodity has a right. The buyer has a right. The business has a right. The management has a right. The employed person has a right. The first is the right of honest quality. The second is the right of honest price. The third is a right of honest profit. The fourth and fifth are the right of honest reward. You cannot thin out any right for the exaggerating of another right without destroying the balance. And this is exactly what has been done in one way or another. Business has not been managed for all; it has been pulled and hauled between all.

There is always plenty of preaching to employers what they should do, as if they were the sole factors in the situation. And it sometimes begets a desire in employers to preach back. The matter is already at a place where the utmost efforts of a progressive employer are neutralized by a system that simply discounts every industrial advance that can be made.

Let it be recognized at once that the ideal to be striven for in the worker's behalf is an honest wage—not merely a "living wage," but a wage that provides a margin for something beyond a living, for the better things of life. And let it be recognized that with this there should go continuity and security of employment.

Beyond these, let it be recognized that it is an industry's duty to the public to produce its commodity at the lowest cost consistent with quality workmanship and material.

So, then, we have the public getting greater value at less cost, and employes getting high wages, wages that give them a margin for the better things of life. And this is not mere supposition. It actually occurs. These things are not dreams, they are actualities. They are being done.

What happens? Why, along comes a system that requires the worker to give up not only all his margin, but scrimp his living as well. That actually occurs. How? The dollars men receive may have as much as 40 cents chipped out of each of them. The dollars in the pay envelope have been deprived of much of their buying power. A concern gives its men high wages, and in every line of business there comes an increase in prices that simply neutralizes the effect of good wages. A factory increases its wage rate—and up goes rent, up goes bread, up goes clothing. There are more dollars, but they buy less.

This is a plain statement of what actually occurs. The commodity in mind is sold to the public at a lower price than before the war. Measure this in the purchasing power of dollars now as compared with then, and the price of this commodity is lower still—really 40 per cent lower than appears. This has been accomplished by a single industry trying to do right by the public, the business and the men.

But there is apparently no one engaged trying to make the dollar follow the same good practice.

Everyone is busy telling industry what it should do; when are they going to begin to tell Finance what it must do? With industry ever striving to give more for the dollar it receives from the public, and yet receiving less raw material for the dollar it gives the material supply; with industry ever striving to give more wages to the worker, and yet facing a financial situation that takes every wage increase and actually turns it into a wage decrease—it is time to pay a little attention to something besides Industry.

What we have overlooked in this country is the fact that there is a Money Business, just as there is a Bread Business and a Clothing Business and an Automobile Business and a Farming Business—and this Money Business is in business to make money out of money. And the only way to make money off money is to shave it somehow. People used to do this quite directly, they would shave the gold or silver coin itself, or bore out some of the precious metal and plug it with lead. That was rather crude and was punished with the penitentiary, sometimes worse. Another way to make money out of money is to make it hard to get so that people will always pay high to get it—borrow $100, receive $90, and owe $150. Another way was just to take a dollar and reduce its purchasing power to 60 cents.

And yet, no one seems to be doing much about it. To call attention to the Financial system is considered a sort of treason to stability. Well, Industry has gone ahead obeying its conscience and working toward a better order of life. But having come thus far it finds its efforts neutralized by this queer twist in Finance. The logical result of this is that Finance is in for the same scrutiny that Industry used to receive, and the same compulsory improvement.

INDUSTRY has been successful in procuring for the worker a wage that provides a margin for something beyond a mere living. Akin to this is the giving to the public of greater value at less cost. When the fact that a commodity is being sold at a lower price than before the war is measured with the present purchasing power of the dollar the price is lower still. There is a money business in this country just as there is any other business, and one way of making money out of money is to make it harder to get. Financiers do this by methods that would be severely criticized if used by the industrialist. Were an industrialist to lower wages and raise prices he would arouse a storm of criticism; but what of the financier that lowers the value of money and makes it less procurable?

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Are Wages Too High?

FROM the report of the Department of Labor somewhat may be learned of the condition of the employed classes, the men whose families must be sheltered, fed, clad and educated on the income derived from manual labor. The income of a workingman is not what he is paid an hour, nor a day, but what he actually receives in the course of a year. It is on the *annual income* that we must judge the worker's ability to make ends meet.

It will therefore surprise many to learn that the average yearly earnings of industrial employes in 1924 was but $1,300.

This average is not made up of the entire army of labor, for the year saw ten per cent of the available labor of the United States unemployed. The average is reached by dividing the total wages paid by the number employed. It takes no account of the number of days when workers were "laid off." It takes no account of the fact that an "average wage" means that for each man receiving more than the average, one, or two, or more receive less.

Steadiness of employment is therefore an element to be reckoned with. An ordinarily steady year should give 300 working days, but what with accident, illness and shutdowns, the number is often reduced. The trend in this country is toward high wages and steady employment.

There is, of course, always that type of mind which sees in these facts the opportunity to secure a decrease of wages in return for a promise of increased steadiness of work. Not only must the organization of industry be based on the principle of continuous operation, thus providing steady employment, but a "living wage" and a civilized wage, which leaves a margin, must be part of the service of industry. Nor is this all. We have learned that it is not only the wage, but what can be bought with it, that constitutes part of the problem. Increasing the number of dollars at the industrial end of the process is not an improvement while decreasing the buying power of dollars at the other end of the process. Steady work; a wage that includes a profit; and a dollar that buys a dollar's worth—these are sound principles.

France's Bogey

THE necessity of keeping "watch by the Rhine" has ever been France's bogey. Across this broad river the Gallic and Teutonic races have surveyed each other for centuries, and ever since the Franco-Prussian War, with all its bitter memories, this natural boundary has been guarded by the French more jealously than ever.

And now it is reported that Britain is willing to remove this nightmare that has troubled France so long, if that country will consent to cast off her militaristic attitude, and talk disarmament. No doubt were the fear of invasion from Germany once removed from France, that country would be more amenable to any suggestion for cutting down her forces or to any international scheme which had this for its common object.

The humiliating terms imposed by Bismarck on defeated France still rankle in the minds of the people, and France has made herself believe that Germany harbors revenge for her defeat in the late war, and is lying low until she gets her fighting machine into trim again. As long as this mutual distrust prevails there is a possibility of renewed trouble. The "snarling tikes," used by the plowman poet as a figure for two potentially belligerent nations, is quite applicable in this instance, and they now "snarl" far more than is compatible with the peace of Europe.

If Britain can solve the difficulty by policing the Rhine boundary, so as to allow France to turn her attention to more peaceful things, it will be doing good work.

If there is going to be another disarmament conference at Washington in the near future, it would be well if not only France, but Germany, were represented. Why should not these great and ancient peoples shed the past and plan a future based on mutual understanding and good will? Their common interests demand it. Europe and the world are looking for it.

News Reels and Reeling News

A CERTAIN droll writer, whose daily observations are printed in newspapers all over the country, remarked lately that the movies seemed to be going stale. And he added that, if any movie house wanted to refresh its audience, gratefully surprise it, earn its lasting kindly regards, let it give a solid show of news review pictures.

That seems like common sense. Who has seen anyone look bored while a news reel was being shown on the screen? Probably no one. And the chances are that a solid evening of news reels, with maybe a couple of travel and educational pictures added, would be a great rest for everybody, and would draw large crowds. Lots of people who are about fed up on "Torpid Lives," "Supine Souls," and "Lethal Loves," but who won't admit it, would probably jump at the opportunity to see a full program of varied happenings and scenes of a newsy and educational sort.

Right here is a good place to say something about the stuff published in the daily press under such headlines as, "Love Betrayed—$100,000 Balm Asked," "Hollywood Scandal Bared—Director Jailed," and so forth. There are plenty of people who want a rest from *that,* too, but who don't know where to look for it.

Then, again, reading nothing but the daily press is like riding a fast train: you see patches of everything, and the whole of nothing. You get information enough, but it's as bewildering in its way of arriving as a cyclone. A whirl of words that leaves the reader completely confused.

But the remedy for *these* drawbacks is available. If you feel the need of relief from sensational exposures and a little solidity and orderliness in your confusion, just begin reading a calm-tempered weekly review that deals in sound, sober surveys of events as a whole. That's an excellent way to keep the latest scare from running away with you. Try it.

Which Is Nobler?

A FRENCH jury, with typical regard for feeling above facts, has set a dangerous precedent. It has decided that *murder is justifiable under certain circumstances.* A certain Mdlle. Uminska, talented Polish actress, shot the Polish writer Zysnowski, who was dying of cancer. Uminska, who was passionately devoted to Zysnowski, and who had attended him during his illness, committed the deed because of his expressed wish that some one would "put him out of his intense pain."

The prosecuting attorney threw up the case, leaving the jury to decide, and Uminska was acquitted.

No man can ever predict what a French jury may do; but the decision that a person in pain may be shot like a disabled or wounded animal opens the way to appalling possibilities. Who is to decide that a case is really hopeless or that the patient is only in great pain? It is common for neurotic persons, or for a man with the toothache, to feel that they have come to the end of endurance. Are such persons to be taken at their word when they express a desire to be relieved of life?

The idea is too fantastic for serious consideration. Homicide is but too lightly regarded even now, and such a perversion of the law against the taking of life if persisted in would leave behind it a hideous trail.

During the late war, surgeons performed miracles in piecing together shattered humanity. Examples of sublime fortitude and devotion to duty were by no means rare. By such examples the world is made better and braver, and the human race is ennobled. This cannot be said for the precedent set by the jurymen in France.

A New Exodus

DURING the past year no fewer than two thousand applications for visas were made by Jewish rabbis to United States consulates in Poland. There is an ever-increasing emigration of rabbis from Poland, mainly to the United States. This exodus, it is said, is due to the economic crisis in some parts of Poland, owing to which the Jewish congregations are no longer in a position to assure a decent living to their spiritual leaders.

The authority for this statement is the London *Observer,* and the source of information is its correspondent in Warsaw.

Whatever is the genesis of this exodus, the reason behind it as given by the *Observer* correspondent seems a somewhat peculiar one. The primary cause is stated to be the "economic crisis" which at present afflicts Poland, and the secondary cause, that the Jewish congregations have become so poor that the rabbis cannot get a "decent living."

If all of these applications are from bona fide rabbis, it looks as if the Jews in Europe, but particularly in Poland, will soon be wandering in the wilderness without spiritual shepherds. And certainly there is no demand for 2,000 more rabbis in the United States. According to Jewish reports, there are now too many rabbis of the Volstead variety.

According to American immigration laws, rabbis, like other clergymen, are freed from the obligation of being included in the immigration quotas on producing their credentials. American consuls apparently think there is something wrong with the whole business, because despite the fact that the applicants have presented all necessary documents and certificates the consuls are refusing to grant the necessary visas owing to the excessive number of applications.

This seems a very wise course to pursue pending a more convincing reason for the rush of rabbis to America. We do not find, despite the destitution that undoubtedly exists in England, that there is a corresponding exodus of the clergymen of the established church, or that thousands of priests are deserting their flocks of impoverished Belgium with the blessing of the Supreme Pontiff. Why rabbis should be alone represented in this exodus raises a question.

Undoubtedly American consuls are acting discreetly in ceasing to grant visas to rabbis until some better reason is adduced for their desire to leave Europe in such numbers.

A Costly Whistle

DURING the year 1924 the people of the United States paid $10,000,000,000 for maintaining their various forms of government. This establishes a new record. One might juggle with these figures and try to find out exactly what they mean to the country. It is estimated that they represent an expenditure of more than $20,000 a minute.

This is a colossal sum, and one wonders whether the country is not "paying too much for its whistle." The Federal Government, of course, comes first in the using up of this mountain of money, followed by the state and municipal governments. Are those who have to foot the bills for these various forms of government getting value for their money? Are things being run as they ought to be?

Now and then we hear of some government department or of some city or town where the financial management has shone like a star in the cloudy heavens, but the story is usually of quite a different nature.

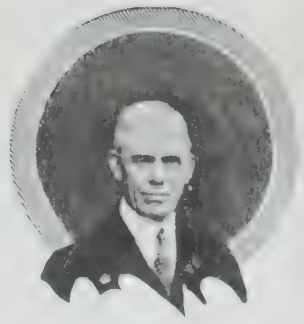
Are there too many government jobs, and are there too many men for the jobs that there are? These are questions to which it might be well to find an answer. But where is the process of investigation to begin? There is certainly an impression abroad that the administrative end of this country is shamefully overstaffed, and that thousands of jobs have been created simply to satisfy hungry office-seekers. This is not attributed to the fault of any particular government or to any particular form of government, but to a fungus-like accumulation of many years.

Have not a good many offices seen their day; are not others obsolete? Has there not been within the past quarter of a century or so a huge multiplication of laws, and a corresponding increase of those who are supposed to administrate them? Are there not a good many administrators who do not administrate and officers who have very little to do?

In view of the billions spent—and the amount is still rising—would not this be an opportune time for a general stock-taking and inventory of all the governmental paraphernalia which has hitherto been considered necessary to secure us that liberty which is our proudest boast? It would be well to know if we are really paying too much for our whistle, as the boy Franklin did.

Some Boys Who Saw Alaska

Teaching Young America to "Think Continentally"



George E. Buchanan.

By E. L. M'COLGIN

ALEXANDER HAMILTON once asserted that it was necessary for Americans to "try to think continentally." George E. Buchanan, of Detroit, has devised a plan whereby groups of boys, during their summer vacations, may acquire a basis for such thinking.

As a small boy in Ontario Mr. Buchanan secured for himself a journey from Thamesville to Glasgow. Being in the employ of a shipowner whose boats crossed the Atlantic, he one day requested the shipowner to permit him to go abroad on one of the vessels. His employer, an outspoken Irishman, at once asked,

"You mean you want me to give you the passage?"

"No," the boy replied, "I have saved one-half of the amount, the other half I intend to earn and repay when I come back, if you will let me go."

That voyage convinced Mr. Buchanan that travel is the best education for business and for life.

Out of that voyage, and many subsequent ones to Europe and to all sections of North America, there grew a dream, out of which in turn there grew the subject of this article: Mr. Buchanan's trips to Alaska for boys.

One evening in 1923 he was talking to the son of a friend about Alaska. The interest of the boy led Mr. Buchanan to unfold to him the first tentative plan of his friendly scheme. He and the boy talked it all over; the amount of time and money that would be required, what the boys would see, how it would benefit them. He had reached the conclusion that a trip to Alaska, of all possible trips, would be of most profit to young boys as a first venture at seeing the world. It would furnish them with an adequate idea of their own country, they would see the glacial stages through which the section of the earth to which they were accustomed had passed, and they would come into contact with a life which appealed to Mr. Buchanan as being broader, less selfish, and more healthful than that in the midst of which they lived.

A few days later a group of this boy's school friends met with Mr. Buchanan who set before them a completed plan. The trip to Alaska would require a month, July would be the best time; the cost for each of them would be $375; it would be an orderly and comfortable trip in Pullman cars; wherever they stopped they would live at the best hotels; a scout master and a physician would accompany them. The itinerary should include Chicago and St. Paul on the way to Calgary, which they would reach in time for the annual round-up of the West. From there they would travel to Banff and Lake Louise, two of the most glorious places in the Rockies. Then on to Vancouver where they would leave the Canadian Pacific Railroad and take one of the Canadian boats which travel up the inner channel, so that the boys should escape possible seasickness and see the wooded islands, foothills, gorges, and steep waterfalls of the nearby mainland. The water journey would end at Skagway, the tragic center of the gold rush of '97 and '98. From there the boys would proceed to White Horse by way of the White Pass and Yukon Railroad which follows the mountain trail over which the gold-seekers made their difficult way. On the return journey they would stop at Carcross, Atlin, Skagway, Vancouver, Victoria, Seattle, Portland, Spokane, and Butte.

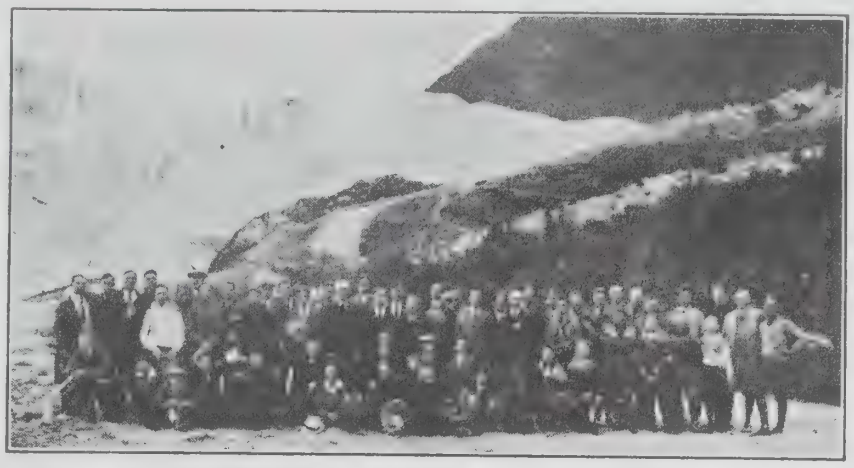
It was a prospect to stir the blood of any boy who had read Rex Beach or Robert Service or, for that matter, of any boy at all.

The means by which Mr. Buchanan proposed to make it actual were these: Each boy should earn and save between that date and the close of June, $125; each parent should contribute $125 as an investment in the education of his son, and Mr. Buchanan would supply the remaining $125 as the Ontario shipowner had once supplied a similar sum for a similar journey to him, and on the same terms, that the money should be repaid out of the boy's subsequent earnings. The money might be returned at any time during the next dozen years. There were to be no promissory notes exchanged, the agreement would be verbal, a gentleman's agreement. In the event that a boy's parents should be unable to let him have the $125, which Mr. Buchanan felt they should be ready to invest in a boy who had the industry and the thrift to earn and save his own one-third of the total $375, that should be no deterrent; in such a case Mr. Buchanan would himself assume the two-thirds.

At a later meeting of a larger group, Mr. Buchanan disclosed that the money could best be earned by salesmanship, and that he would be glad to buy at wholesale for the boys a supply of pencils, housewives' spatulas, fire shovels and coal baskets, all articles for which there should be a ready sale. They might also, if they wished, sell coal for his company at the regular commission.

Within a few weeks there were 179 boys sending for railroad folders of the Canadian Pacific, the Northern Pacific, and the Union Pacific, reading books about Alaska, studying maps of it, seeing motion pictures that illustrated it, in the intervals of school and studies, and selling to everyone with whom they could come in contact, pencils at ten cents, with a profit of six; spatulas at fifteen, with a profit of eight; japanned baskets at fifty cents which allowed a profit of nineteen, and fire shovels which they sold for fifteen and on which they cleared five and one-half cents.

There were, ultimately forty-four boys who made the first trip. Not all of them were Detroit boys. One of them lives at Medicine Hat, Canada. Each of these lads had earned his complete sum. Half of them did it by selling the wares which had been provided for them, others earned it by caddying, selling newspapers, constructing radio sets, working as messenger boys. Of that group one-third have repaid in full the sum which Mr. Buchanan had advanced and 50 per cent of the remainder have made substantial payments.



Guests of the Juneau Boy Scouts, Mendenhall Glacier.

Party at New Westminster, British Columbia.

Parents were not accepted for the trip. Away from his parents, from the home atmosphere, a boy had a better chance to practice self-reliance. But that the boys' welfare should be entirely safeguarded, a second physician and also three women were taken along. Mr. Buchanan wished the mothers of the boys to feel that if a woman's care was needed it should be forthcoming. The entire sum of $375 was turned over to each boy's care and keeping. Each boy went to the station to buy his own ticket and make his own reservations. Each went to a bank and bought a New York draft for $25. When any boy, along the route, at any time needed to be identified at a bank, that was his personal affair and he attended to it himself.

The boys looked after their own clothing, with a little help now and then from the women of the party. There were minor differences between them but there were no rows and no instances of flagrant bad manners. Some of the hotels were a bit uneasy at having such a troop of youngsters swoop down upon them but they were pleasantly surprised. At the outset of the journey Mr. Buchanan offered five dollars as a prize to the boy who, during the trip, made the fewest complaints and carried the best smile. It was difficult to decide the winner.

Mr. Buchanan ascribes the success of what must seem, to any adult person, an appalling undertaking to the method by which the boys had been chosen. Boys who will earn and save $125 at the rate of six and eight and ten cents at a time are by that very fact boys of good character and manners and of set purpose.

In Alaska the Elks and the Boy and Girl Scouts entertained the Detroiters. At Ketchican the Elks enabled the party to see the Navy's wireless station and the canneries, at which each boy was given a can of salmon. At Juneau the Elks drove them all, and for friendly companionship the local Boy Scouts were included, to the Mendenhall Glacier. It is a branch of the great glacier Taku which the boys had seen from the boat that afternoon. By special arrangement the boat's course had been altered so that the boys might have a sight of that enormous glacier which gleams like a radiant diamond.

At Skagway the Girl Scouts took them to Smuggler's Cave, and the Boy Scouts took them for a mountain hike for which the Elks provided the food. They also saw the gold mines and an Indian village dance.

At Lake Altin they made the longest stop. They lived for five days at the White Pass and Yukon Railroad Inn, and from it, in groups of the whole and in small groups they explored the region. They saw fox farms, gold mines, totem poles, fished, came to be on friendly terms with a jeweler who possessed a power boat and took them for rides on it; they bathed in warm water pools, ate good food, and feasted their eyes and souls on a matchless lake and noble mountains.

From Lake Altin they traveled back to Carcross and White Horse with the sensation of being in very familiar localities. There was a short stay at Vancouver, and enough time at Victoria to see the Parliament Building and the museum. At Seattle and Portland, Spokane and Butte the boys were given great meals, long motor rides, free swims, free movies, a chance to see thoroughly the warship *Arizona* and the great mines at Butte. All this by courtesy of the Kiwanis Club, of which Mr. Buchanan is a member. Chambers of Commerce, Gyro clubs, Elks, Boy and Girl Scouts, and other bodies added to the trip more than money could buy.

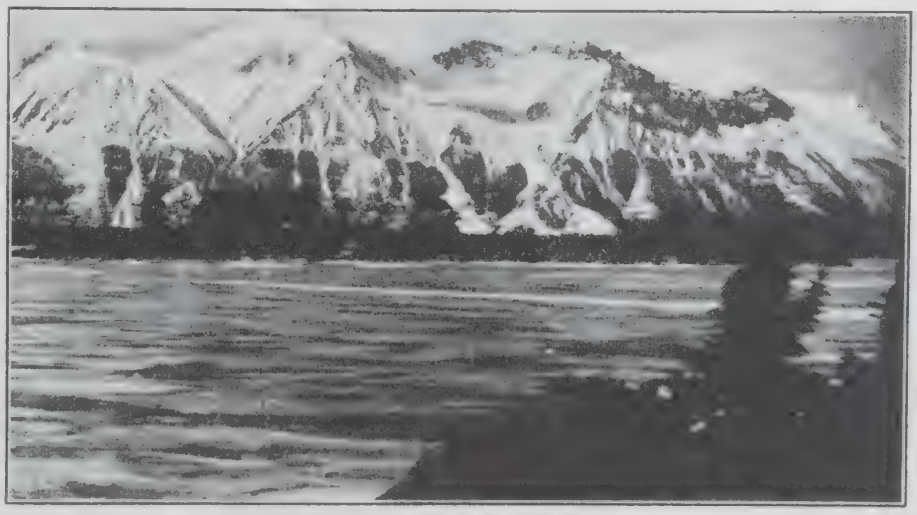
It is apparent the boys had a very happy month, that with every breath they drew they were filling their minds with a vivid knowledge of the capacity and the beauty of their country.

Alaska is now a real land to these boys, a real part of America. They can characterize the ambitions and the manner of life of its various inhabitants, the nature of its cities and villages, the needs and potentialities of the country, and they have, as the photographs in their possession amply show, a realization of the great beauty of the country through which they traveled.

Their horizon has become wide; they think, to a degree, continentally; they have a living comprehension of the size and intricacy of the world. Thrift has a meaning for them, that it might never have had without this particular trip. It spells opportunity for them. They all give one the impression of unusually developed boys, with a sense of freedom and of confidence in themselves.

Mr. Buchanan fully realized what these trips mean to the development of the boys. He has said, "I intend to carry out this plan as long as I live and to arrange that when I die there will be someone to continue it. I shall create a foundation and this foundation shall be the only monument I shall want."

To anyone who has ever looked after forty-four boys on a picnic, and who knows all the exigencies of travel, it must be apparent the forethought and knowledge that were required to make a month's journey across the American continent and up into Alaska with a collection of boys of varying ages, training, health and strength.



Mount Atlin, Alaska.

Church Union Causes Disunion in Canada

Part of the Presbyterian Body Declines to Sink Identity in New Plan

By F. T. YEALLAND

The Presbyterian church in North America was founded by the Scottish, Irish, French, German, and Dutch Reformed immigrants. The founding of a Presbyterian colony on Massachusetts Bay took place in 1625.

In Canada the Presbyterian church dates from the conquest of the country by the British in 1759. In Upper Canada, now called Ontario, the Pioneers of Presbyterianism were from the Reformed Dutch church. One of the earliest missionaries was the Rev. Robert McDowell, who was sent by the Classis of Albany in 1798. Other ministers were sent from Scotland, and later, with immigrants from Scotland and the North of Ireland, Presbyterianism took firm root in Canada.

CANADA has witnessed within its far-flung borders in recent years the most bitter religious strife it has ever known—a strife that has been extremely intense since last midsummer. It is not a holy war, not even a religious war, but a revolt among the largest of three religious armies, leaders of which had signed a treaty of peace and unity that only needed the agreement of the rank and file to make it effective. Two of the armies accepted the treaty without demur, but part of the third not only rejected it, but prepared to fight it to the last ditch.

Ever since 1914 a feeling has been growing among the membership of the Presbyterian church, in opposition to merging with the Methodist and Congregational bodies—a feeling which increased as the time for voting on the question approached. Congregations have been divided more or less evenly on the subject; ministers have found themselves in conflict with their sessions (as the boards of elders are called); sessions themselves have been split into two camps. Tons of literature have been sent out by both sides, the daily press has been flooded with letters on the subject; addresses for and against union have been given at public meetings, but so conflicting have been the stories told and arguments used that the average man has found himself in much the same position as during a political campaign.

The Greatest Experiment for Centuries

The present century was scarcely four years old when the movement for organic union of the Presbyterian, Methodist and Congregational bodies started. There had been church mergers half a century before, when the then existing different Methodist bodies joined together peaceably enough, and later, when three Presbyterian bodies merged; but this latest movement dwarfs those earlier ones into insignificance. It is the boast of unionist leaders that the United Church of Canada is the greatest experiment in Christian reunion since the Reformation.

At the Presbyterian General Assembly in St. John, New Brunswick, in 1904, a report was read from a committee appointed the previous year to the effect that the Presbyterians were at one with the Methodists in their desire to promote organic union. No further progress was made for six years or so, but all the while the Methodists and Congregationalists regarded it as a practical and all but accomplished fact.

In 1911 a vote of the presbyteries was taken, when all but three of the seventy expressed their opinions on the subject, fifty voting for union and seventeen against. The General Assembly next sent the question to the church at large, and the membership voted, roughly, 288,000 in favor and 107,000 against. The assembly in 1912, in view of the substantial character of the minority, decided to delay further action, the prevailing belief being that there should be something more approaching unanimity before the church should enter the merger.

The opposition of the minority has been strongly in evidence ever since. When next came the vote-at-large of 1915, the anti-minority was increased by between 30,000 and 40,000. This was highly encouraging to the opponents of union, who predicted that another vote would show an actual majority opposed to the plan of union. But another vote was not allowed. The General Assembly at Winnipeg in 1916 formally committed itself to union by a vote of four to one.

A truce was granted by the Assembly in 1917, the war being the chief consideration then. At the same time the various branches of the church were instructed to do all possible in the way of co-operation with the two other merging churches, the result being that union actually became effective in many outlying sections of the Dominion.

The World War ended, the opposition to union was renewed with increased vigor. The Presbyterian opponents loudly demanded another vote. This clamor was at its height when the Assembly of 1923 met. At this convention Dr. Drummond, of Hamilton, proposed as a compromise a federation scheme which, if adopted, would doubtless have prevented further Presbyterian strife. But the Assembly felt it could not break faith with the other parties to the proposed merger and by a four-to-one vote indorsed the bill incorporating the United Church of Canada.

Assembly Endorses the Bill

The bill was introduced at last year's session of the Dominion Parliament. To this measure the keenest opposition was offered. It engaged the attention of the House of Commons and the Private Bills Committee for many days and was stubbornly fought every step of the way. The antis succeeded in having it amended in certain respects, the most important change, perhaps, being that which gives *each congregation the right to vote whether to go into the union or stay out of it.*

This amendment has enabled antis in each congregation to make a final stand in defense of what they call their property rights and to continue the Presbyterian church with all its beloved traditions. The act passed by Parliament fixes June 10 next as the date for union to become effective, but allows six months' time prior to that for the taking of congregational votes, which commenced on December 20 in hundreds of Presbyterian churches throughout the Dominion.

Strong and active as was the opposition in the earlier years of the agitation it has become more so since the passing of the Church Union Act. While Methodists and Congregationalists, who also have the right to vote on the merger, have accepted union without one congregation thinking it necessary to take a ballot, the Presbyterians have conducted campaigns for and against. This is particularly the case in the larger communities of Ontario, the real hotbed of strife. The antis have taken the aggressive and exhort church members to "stay with the good old Presbyterian church, its forms and beliefs"; the unionists urge them to "come with the Presbyterian church into the union." The antis declare the church of their fathers good enough for them; the unionists cry "You'll never know the difference when you enter the new church." The antis claim the Confession of Faith and Shorter Catechism have been scrapped by the unionists and that the religion of the United Church is a creedless one, claiming that questions asked of candidates for the Union Church ministry may be answered by any minister of any sect in Canada and that no minister or elder will be asked to subscribe to the doctrines of the basis of union or promise to teach according to it. Antis claim, further, that the cherished right of "calling" a minister is taken from the people; that the United Church is given powers greater than a private corporation, and that "the new church has the thin edge of taxation."

According to unionist claims, a congregation entering into union will carry on every branch of its work as in the past. Its organizations, ministers, elders, and other officials will maintain their present standing and function as before. Even the order of worship and the Book of Praise will remain unchanged. Self-determination is allowed every congregation entering union, and the United Church will have no power to compel one congregation to unite with another. Local opinion will be taken into consideration and the people will be consulted before any change takes place, *but management of local affairs will be subject to the legislation, principles and discipline of the United Church.* Unionists insist that the right of a congregation to call its own minister is guaranteed.

Methodists Give Their Viewpoint

The earliest date on which, under the act of incorporation, congregations could start voting was December 20 last, and seven weeks after that date 1,544 congregations had expressed their views on the great question through the ballot. Everything has been conducted according to regular form. Voting covers a period of fourteen days—two hours each in the afternoon and evening. In the majority of instances both sides work vigorously and the result has been that in many cases as high as 90 per cent of the qualified vote was polled. In the campaign, women, particularly those opposed to union, have taken a large part.

It is noteworthy that the majority of congregations vote in sympathy with their ministers, which shows the power of clerical influence among persons who are wont to shrink from the very thought of "priestly domination." It is of perhaps equal significance that where a congregation has voted against its minister the majority is almost invariably against union.

A serious matter in this connection is the number of unionist ministers who have promptly resigned their charges rather than remain with congregations opposed to them on this question until the going into effect of the merger. In Toronto Presbytery alone six ministers have already resigned. To replace such as these and to find churches for them will be difficult problems for both the antis and the unionists. As a rule, whichever side wins the dissatisfied elders at once resign.

Meanwhile the Methodists point out that they, too, are leaving the church of their fathers—a church not without its history and traditions, but they are willing to make sacrifices.

The antis make their best showing in the Ontario cities, where many of the largest and wealthiest churches have voted to keep out of the union. The voting thus far serves to emphasize what has already been stated here—that Ontario is the heart of the opposition to union. While the Dominion as a whole shows a little over three congregations favorable to the merger to one against, the standing in the province named is considerably less than two to one. Thus far more than three times as many Ontario churches have gone against union as in the rest of Canada combined.

The big showing made by the union cause is to some extent due to many small augmented or non-self-sustaining charges, missions and stations in outlying sections of Ontario and the West deciding to enter the union without taking a ballot. It should be understood that under provincial acts voting in two provinces, New Brunswick and Manitoba, will not begin until the date union becomes effective, June 10.

In the whole of Canada there are 1,908 self-sustaining Presbyterian churches, 1,221 augmented congregations and 1,250 small missions. In the returns received from the seven provinces in which voting has been in progress since December 20 the decisions of these augmented charges and missions, which for the most part have been made without dissent and in favor of union, are included.

In Hamilton There Is Contention

The standing at the close of seven weeks' voting was: *for union 1,169, against 375.* Anti-unionist leaders express confidence that this ratio will be maintained.

Naturally, more or less disruption is seen in many congregations in the larger centers of population. Congregations have been split up and there has been a shifting and changing never before known. Anti-union members of union-voting churches have gone over to churches which voted anti and vice versa. Unionist members of anti-voting city congregations have in some instances gone over in bodies to the church nearest their homes, even if it happens to be at present under Methodist rule.

In Hamilton, however, where twelve congregations have voted for union to fourteen against, the minorities have taken a decided stand. Both sides feel themselves out of a church home, and rather than join with an existing congregation are meeting in halls and assembly rooms, and if plans are carried out a new Presbyterian and a new Union church building will eventually be erected in the city.

Of importance to both sides is the question of the disposal of property. The federal bill provides for the division of trust funds of the church as a whole, such as the aged and infirm ministers, widows and orphans, century and forward movement funds, colleges and endowments to the denomination as a whole. The act provides for a joint commission of both parties to make the division. There is now awaiting the consideration of the Ontario legislature a bill sponsored by the United Church committee similar to those which have already passed other legislatures and that which was withdrawn from the Ontario legislature at last session.

Mandates for Holding of Property

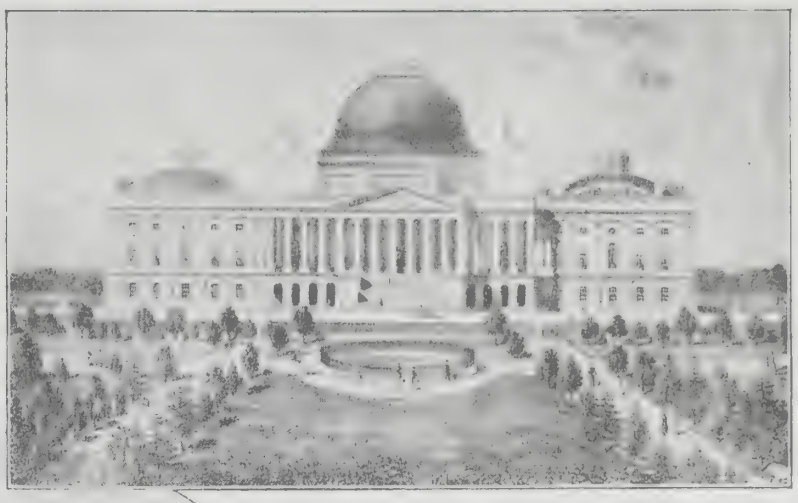
This bill takes the congregation as the unit for the division of church property, including buildings, lands, endowments and all property held by the congregation for its own use. The principle of the bill is that the congregation takes the property with it whether it goes into the United Church or stays out and enters a non-concurring congregation or remains independent. Provision is made for the adoption of votes taken under the federal act, these to serve as mandates for the holding of the individual church property and would avoid the taking of a second vote. There is talk of the antis seeking certain amendments to this bill, the chief of which being to require a two-thirds vote to carry the church property. But this plan, if adopted, would cut both ways.

If union carries there is finally the writ prepared on behalf of the anti-unionists which disputes the constitutionality of the union act. The main point of it is, Has Parliament power to legislate as to the doctrine of any religious body, as it has in the act incorporating the United Church of Canada? The anti-unionists claim to have a negative answer in the highest Canadian legal opinion and a judgment of the Imperial Privy Council. The unionists ridicule the writ.

How Washington Capitol Was Built

British Burned It and Made a More Beautiful Building Possible

By TOM EVERRITT



The Capitol before it was burned by the British.

The Capitol after it was burned by the British on August 24, 1814.

"ON A plateau elevated ninety feet above tide-water stands the Capitol, facing, as it should, the east, thereby receiving the first rays of a rising sun."

An Act of Congress of July 16, 1790, directed the commissioners of the District of Columbia, or, at that time, the "City of Washington," to provide, prior to December 1, 1800, suitable buildings for the accommodation of Congress, on plans to be approved by the President. On March 14, 1792, the first direct movement was made when an advertisement was ordered to be inserted in newspapers in the principal towns and cities proclaiming that five hundred dollars in cash, or a gold medal of that value, at the option of the successful competitor, would be awarded the designer of the plan approved by the President, provided such plan, or plans, should be submitted before the following July 15.

The advertisement having been given a widespread circulation, and having attracted noteworthy attention, it may be presumed that the architectural talent of the United States had a splendid opportunity to reflect itself in the plans submitted.

The results of the advertisement, and the subsequent award made by President Washington, created much unfavorable comment and bitterness at the time, and during several succeeding years, the records show.

(C) Handy Photo.

The Capitol under reconstruction, showing the old Tiber River in foreground. The Tiber River now flows through a 30-foot underground duct, passing under miles of buildings in the District of Columbia.

As to the results, John H. B. Latrobe, son of the actual architect of the present Capitol, in an address delivered before the American Institute of Architects in Washington, D. C., November 16, 1881, said: "I have had access to some eight or ten of the designs offered in competition. All of them are bad, very bad indeed—the greater part below contempt, and some bordering upon the ludicrous. In one, a triple window has a cornice broken by an arch over the central opening, on either side of which is a man rampant, with one foot on the arch and the other on the level of the cornice, as though the two men proposed to do battle over the keystone. This competitor evidently thought himself strong in statuary. Another competitor exhausted himself on the face of a clock, where the twelve letters in the words 'United States' are used to mark the hours. The spread-eagle seems to have been regarded as an essential in some of the designs; and the bird exhibits itself on pediments and in weathercocks in most extraordinary shapes. One of these national birds is carefully drawn with the wings of a penguin and a breastplate of thirteen circles, ingeniously arranged. . . . Take them all in all, they are indeed a sorry lot."

As to the award, or selection of the design for the Capitol, by President Washington, through Thomas Jefferson, his Secretary of State—it went to an amateur architect after all the plans submitted in answer to the advertisement of the commissioners had been considered and rejected by the President and the commissioners.

The amateur architect was a Dr. William Thornton, of Philadelphia, who was prevented from submitting plans in reply to the advertisement by being absent in the West Indies. Upon his return to the United States, he submitted his plan to the President at Philadelphia; the President, in turn, submitted it to the commissioners, with the result that Thornton's plan received a unanimous verdict in its favor.

It was said of Thornton at the time that he "claimed, indeed, no more acquaintance with architecture than he had acquired in two weeks' study in the Philadelphia library." It was also said of him that he was "an English amateur, who had come from the West Indies; was a thorough man of the world; founded a race-course and sported blooded horses." John H. B. Latrobe, mentioned above, said of him, in reply to that charge, "Thornton was more than this, however; he was a man of genius and a philanthropist."

Whatever might or what might not have been Thornton's ability as an architect, the acceptance by the President of his plans for the Capitol was the cause of many bitter controversies between competing architects, politicians, and others in Washington, Philadelphia and New York. This strife continued with varying degrees of animosity, intensity, violence, and vehemency, regularly at times and intermittently at others, until 1802, when Mr. Jefferson, then President, concluded Thornton's engagement in the government.

In 1803, President Jefferson appointed Benjamin H. Latrobe as "Surveyor of the public buildings," which was the title of the office of architect. It may be interesting to note that he received the munificent salary of $1,700 a year to start. This was afterward increased to $3,500.

In the meantime, that is to say, from the date of acceptance of the Thornton plan, peculiar difficulties were encountered as a result of the veiled charges that the Thornton plans were not his, but were those of Stephen Hallet, a Frenchman, then residing in Philadelphia, and whose plans had first been favorably considered and then rejected by the commissioners. The strange similarity of the plans of the two architects was commented upon by all historians of that day and of later days.

At any rate, amid all the discord and quarreling, the cornerstone of the Capitol was laid September 18, 1793, under the auspices of the Masonic Order. President Washington, as Master *pro tempore* of the Alexandria, Virginia, lodge, presided. It is said that he made an address upon the occasion, but no copy of it is on record.

The cornerstone was laid in the southeast corner of what was to be the north wing of the Capitol. An account of that day said of the ceremonies: "A grand Masonic, military and civic procession was formed on the square in front of the President's grounds, whence it proceeded to the Capitol with martial music and flying colors, attended by an immense concourse of spectators. The ceremony was grand and imposing, and large numbers from various parts of the country attended."

A large silver plate was placed upon the cornerstone, which was inscribed:

"This southeast corner-stone of the Capitol of the United States of America in the City of Washington was laid on the 18th day of September, 1793, in the 13th year of American Independence, in the first year of the second term of the Presidency of George Washington, whose virtues in the civil administration of his country had been as conspicuous and beneficial as his military valor and prudence have been useful in establishing her liberties, and in the year of Masonry 5793, by the President of the United States in concert with the Grand Lodge of Maryland, several Lodges under its jurisdiction, and Lodge No. 22, from Alexandria, Virginia."

Within a short time after the cornerstone had been laid, a bitter wrangle arose between Hallet, who at this time was engaged as an architect on the Capitol, and Dr. Thornton, who had been appointed one of the district commissioners. The demand had been made upon Hallet that he furnish the commissioners with his drawings and designs of the Capitol. Upon his refusal to accede to this demand, he was dismissed from the service of the government. George Hadfield, an English architect, then undertook the task of completing the Capitol; but he, too, had a

Said to be the best photograph of the Capitol as it now is.

China a Country of Many Wars

Only Seventy-eight Years of Uninterrupted Peace in 2,000 Years

By MRS. L. M. CRAMER

IN SOME manner—I'm sure I can't understand how—the idea has become prevalent about the world that China is fundamentally pacifist and that the wars which of late have come regularly upon the people were practically unknown before the country became a Republic, scarcely a dozen years ago.

Sir John Jordan, who is perhaps one of the best informed men in the world today on China and her history, made a statement within the fortnight that out of *the last 2,000 years China had enjoyed but 78 years of uninterrupted peace.* There have always been wars in China, and history shows that wars between Kiangsu and Chekiang provinces were fought more than 2,500 years ago and have been fought frequently ever since. The present war, which is but a ramification of the latest Kiangsu-Chekiang war, started on the third day of last September. None of the wars fought between these two provinces in the last 2,500 years has settled any question, and the latest one promises to settle less than any of its bloody predecessors. At this writing (December 23) it seems that the muddle into which the latest war has resolved itself is impossible to straighten out. At this minute, while active warfare is at a standstill, the fact remains that practically all China's provinces are more or less involved and ready to spring at some other province; and that banditry is rampant throughout the Republic, as never before. No one here, not even the most optimistic pacifist, is deceived into believing that the war is over.

The first war between the Kiangsu and Chekiang provinces, of which I can find any record, was fought 2,500 years ago. At that time Kiangsu was known as Wu province, and Chekiang was called Yueh. They were regarded then as barbarous states by the Chinese who inhabited North and Central China. In 490 B. C., Yun-chang, King of Yueh, died. Hoh-lo, King of Wu, seized the opportunity to attack Yueh. He was defeated in a great battle fought near the present town of Kaising—a town which figured largely in the last days of the active fighting between Kiangsu and Chekiang in the present war. The King of Wu died as the result of wounds received in that battle. With his last breath he bequeathed the quarrel to his son Fu-ch'a.

Lest he forget his father's dying command Fu-ch'a is said to have caused a guard to be stationed in the great hall of his ancestral palace, whose duty it was to call out thrice daily: "Fu-ch'a, have you forgotten that the King of Yueh killed your father?" To which the son always answered, "No, how dare I forget!"

For three years the young king prepared for war, and then in a naval battle fought on Taiho Lake, near the present city of Soochow, he defeated the troops of Yueh, and carried their king, Kou-tsien, a captive to the palace in Soochow where the young Wu king lived for part of each year, and there made him a scullion in his stables.

But Kou-tsien was clever and cunning. By subserviency and even loathsome sychophancy the King of Yueh at last managed to win the confidence of his enemy. He was allowed to return to his own kingdom, to hold it henceforth as the vassal of his overlord. He returned, but the taste of the bread of humiliation which he had eaten was still bitter in his mouth. He wanted revenge, and to keep his hate alive he slept on a pallet of brushwood, and ate with a gall bladder placed always in front of him as he sat at his table. He practiced the most rigid economy in his state affairs, and unweariedly trained his troops for war. He did not hesitate to stoop to duplicity and once he allowed a very beautiful peasant girl to be taken captive, trained her in all the seductive arts and graces, and sent her with rich gifts as a tribute to the King of Wu. Just what Kou-tsien hoped would happen, really did happen. The King of Wu became so enamored of this beauty that she was able to beguile him from all his cares and duties of state into a condition of forgetfulness. He passed his days in dalliance with his new favorite who is said to have been Si-shih, perhaps the most famous beauty in Chinese history.

Command to Commit Suicide

SO BEWITCHED was the king that when his counselor, Wu Tze-hsu, sought to expostulate with his sovereign over the wasted time and the lax life he was leading, seeking to point out to him what such laxness foretold to him and his kingdom, the king's reply to the repeated warnings of the wise advisor was to send the royal sword to the faithful servant—really a command to commit suicide.

And the wise old patriot—so the story goes—did commit suicide, but not before he sent his king the following note: "It was by my aid that your father became king. You yourself were made heir to the throne at my advice. Now you send me to my death." To his own servants he gave two orders: "Plant my grave with Kia trees: that wood is good for coffins and they'll need coffins soon in the Kingdom of Wu." Then he commanded that after his death his eyes be taken out of his head and placed over the gate of the city, that he might see the fulfillment of his predictions—the troops of Yueh advancing to breach the walls. The command was carried out. The city gate still stands. It is the main gate into the modern city of Hangchow, the largest city in Chekiang province. The gate is named for the brave old man, and there is a tradition in Hangchow that every year when the bore rushes up the river, the spirit of Wu Tze-hsu rides on its angry waters, menacing his old enemies with his vengeance.

Twenty-three years after the passing of old Wu Tze-hsu, the Kingdom of Wu tasted the bitterness of defeat, for in history it is recorded, "In the 22nd year of the King of Ai, Yueh destroyed Wu." The King of Wu committed suicide by his own hands. Early in the present war the North China *Daily News* commented editorially on this history, saying: "A war between these two provinces was fought 2,500 years ago, and in the present year of grace Wu (Kiangsu) and Yueh (Chekiang) are once more at war, and if there is any more intelligent reason for this conflict than there was in 490 B. C. we have yet to learn what it is."

This present war has been filled with the most astounding surprises and situations unbelievable in a civilized world. Men have been honored and in a breath disgraced in these few months, and some who suffered disgrace have been raised to positions high in the land.

Take Marshal Lu for instance. Lu fought a losing game almost from the first day of the war, although everybody had counted him a sure victor. But he fought! He won admiration even from his enemies by the way he fought—even when he was beaten and knew it. He sold himself dearly.

And then he fled, leaving his soldiers cold and hungry. They were in thin cotton uniforms, and cold weather was coming. They were without food, and their leader was a deserter. A general abandoning an army is a despicable creature, and his cowardice was on everyone's tongue.

He made a clean get-away, embarking for Japan and a sure haven of refuge, going between two suns. With him he took several of his generals. This occurred on Monday, October 13. Indignation ran high against Lu.

Then, as from a clear sky came news that Lu had reentered China, through the north, and had offered his services to Chang Tso-lin, marshal and war lord of Manchuria, whose military operations—so rumor has it—have been financed to an extent by Japan.

The second great surprise in this war came from the north, the *coup d'etat* in Pekin when General Feng Hsiang, the Christian general, marched an army into the capital while the city slept, and took it without firing a gun, and without bloodshed. Feng placed President Tsao Kun under guard, and his brother under arrest. The brother died of the exposure to which he was subjected, it is said. Feng denounced General Wu Pei-fu, his chief, and set a price on his head—a very large price for China where life is held cheap. Then when the new government was organized came another surprise: Feng held no office, nor were the men closest to him given desirable positions in the cabinet. The newspapers have been divided as to the reason for this, and as to its effect upon Feng. The outsider knows only what he gleans from editorial writings on matters such as these.

Of course, by his act, Feng had allied himself with Marshal Chang Tso-lin, his erstwhile enemy, against whom he had used his best military tactics for weeks. Then came rumored differences between Chang and Feng, and these rumors still persist. They say the next war will be between these two. Who knows?

Just at this writing Nanking, where both Lu and Chi are quartered, is in a terror of apprehension. Chinese expect the worst. Troops are coming into Nanking, and what the outcome will be no man can tell. Anyway I'm in time for a seat in the grand stand. I arrived four days ago, thinking to spend my winter here in peace and quietness because of the warfare in Pekin.

Merchants in Nanking have hidden away their best goods, and this, coming as it does barely a month before the Chinese New Year, which is January 24 this year, spells financial ruin for many of them who cannot sell the large stocks of goods they had provided in anticipation of a large New Year trade. For many of the merchants there must be a quick turnover or they go to the wall. Soldiers are quietly looting on the outskirts of the business portion of Nanking, and big and little merchants live in hourly fear of a general looting of the entire city.

Even the foreigners are more or less apprehensive, though generally the foreigners live far from the city itself, and the danger to them is comparatively small. It is the merchants and the wealthy Chinese who have the most to fear, and the latter class have made a quite general exodus in the past week into Shanghai and its real or imagined security.

How the war will end, or when, is the question. About one thing, however, there is no question—it will not settle anything. Thousands of men killed in the fighting still lie as they fell, in deserted trenches.

One of the direct causes of the Kiangsu and Chekiang war was the matter of a governor of Shanghai. Shanghai is large enough and important enough to have her own governor, and while she is and was a part of Kiangsu province, and naturally might be expected to have a governor appointed of Kiangsu's choosing, she had instead a governor of Chekiang's choosing.

Lu Sought Haven in Japan

MARSHAL CHI of Nanking, capital of Kiangsu province, naturally demanded that his province have the right to name the governor for Shanghai. Marshal Lu, in his headquarters at Hangchow, capital of Chekiang province, had a "pull" with the authorities in Pekin, and got his man appointed. Then, after months and months of squabbling, war began, and everyone naturally supposed when Lu deserted his troops and sought a haven in Japan, that the war was over, and Chi would have the right to name the governor of Shanghai. He did name that governor, and shortly afterward up bobbed Lu in Manchuria, offering his services to Chang Tso-lin who was at that time in battle with Wu Pei-fu, ally of Chi. It was not so very many weeks after that that Lu's influence with the new government in Pekin began to be felt, Chi's appointee was let out and a Lu follower appointed to the chief executive position in Shanghai. Instead of gathering about Chi, and tendering him their sympathy, for the man had won a doubtful victory after all, the populace offered him one of the greatest insults that could be offered—they solicited funds for an iron effigy of him. Chi retired to Nanking, and, as about that time Wu Pei-fu was declared down and out, it looked as though these two brave generals—for they *are* brave whatever else may be said of them—would rally the Yangstze valley military authorities and start in to clean off the face of China wherever it was bespattered with their enemies. But the expected did not happen. Just now Chi seems to be standing alone, and he is staying in Nanking, with an ever-increasing number of troops, preparing and watching and waiting. In the meantime the Chinese are in an agony of suspense.

Financially this war or series of wars, which started back in September last, has cost many a rich man his last penny. In Shanghai, Nanking, and Soochow this has been especially true. They have dug deep into their treasuries at the demand of the war lords, and they are feeling the pinch. Many are ruined, others will be ruined. New Year will see the finish of many. At New Year a man pays his debts in China—or he commits suicide. A merchant on Bubbling Well Road in Shanghai told me one day recently that there was not a merchant on Bubbling Well or Nanking roads but was passing sleepless nights worrying how he was going to get through the New Year. Of course, many will be able to weather the storm because they have money laid aside, but no business has paid its debts, to say nothing of making money, this last six months, and the man who has not a reserve fund is going to the wall when China New Year comes.

"Many men will die by their hands," said this wealthy old merchant, "and we shall all feel the pinch. A year ago there was peace, and few men failed at China New Year. War is very bad, very bad. I wish my country peace, and then she will have prosperity and happiness."

Billions for Pensions—

Concluded from page 3

in addition to full salaries, monthly compensation for disabilities presumably incurred in the World War. One doctor who was receiving a salary of $5,000 a year for passing on compensation claims was receiving compensation for disability.

What will be the outcome of the tendency of Federal pensions to grow in size and in number?

At present about *one out of every 150 persons in the country is drawing a Federal pension.* If you include those who are to receive "adjusted compensation" it might be said that *one out of every twenty-five persons is receiving or has been promised a pension.*

Some member of virtually every other family in the country is on a Federal pension roll of some kind.

A few years ago the pensioning policy was applied to the civil service employes of the government. Pensions for them were withheld for a long time, in the face of insistent demand and much desert, because of the manifest dangers, if not evils, which military pensions developed.

Pensions for these employes are called annuities or retirement pay, the funds for the present coming from the salaries of all civil service employes. These salaries, however, are paid by the Federal Government, and the deductions necessarily must be taken into account when salaries are fixed.

Only about 12,000 civil service employes have been retired under this law but about a half-million are its present potential beneficiaries.

Already there is a demand that the law be "liberalized," as it has been already in a few respects. This demand no doubt will continue to be made and will be constantly renewed after every new act of liberalization, just as has been the case with military pensions. *For the civil service employes of the government now constitute a possible voting block which those seeking office cannot ignore;* in fact, *it is larger than the majorities or pluralities that have been received by several successful candidates for President.* And it is now well organized, just as are the run of military pensioners, both actual and prospective. And, similarly, pensions or retirement pay is one of the subjects to which their organizations give constant attention.

The ground is now being plowed, in several indirect but palpable ways, for the making of demands on the Federal Government for pensions for groups of persons who have no claim of service, civil or military, for this form of help. *Unemployment pensions* or doles are in the offing, remotely perhaps but there nevertheless. *Pensions for the indigent aged* and for *widows* and perhaps for *mothers* probably are the next to be demanded.

Strong sentimental arguments can be made for all of these. Do not the governments of many other countries, much poorer than ours, provide such pensions? Doesn't ours spend millions on hogs and cattle? Can't the necessary funds be collected from the rich in the form of income taxes?

Thus the prospect is that Federal pensioning will expand not only in old but also in new directions, with the result that pensioners will become so numerous that they may decide, not some, but any national election. This won't happen soon but its coming is foreshadowed by the history of pensions in the past.

Today pensions or their equivalents are costing more than was spent on the operations of the entire Federal Government, aside from the Post Office Department, ten years ago. And in late years Congress has been less reluctant than ever before about granting demands made for these kinds of public benefits.

This Talk of "Scrapping"

Concluded from page 4

their own service of supply because although they may reach distant points under their own power, they can start only with the necessary fuel to take them there; therefore they are of no service upon arrival from a military point of view unless fuel and necessary military equipment can be supplied them. Much of this reasoning in connection with naval operations will apply with equal force to army operations. The airplane (heavier-than-air) is inherently limited in performance by physical laws.

Airplanes cannot occupy territory nor can they exercise control of the sea.

Airplanes cannot reach distant over-sea areas under their own power with any effective military load, and, therefore, cannot operate either offensively or defensively until supplied with weapons and fuel.

(C) Official Photograph, U. S. N.

Torpedo plane formation.

Airplanes cannot fulfill the functions of service of supply for themselves or for other forces in distant over-sea areas.

An editorial recently appeared in one of our leading papers in which an attempt was made to show the advisability and practicability of building airships twice the size of the *Los Angeles* and using them as aircraft carriers. Perhaps the man who wrote this editorial had a sudden happy thought and believed that he had a solution for all of our difficulties in this question. But it was simply another daydream. The editorial evidenced but little knowledge of the real facts. Now, what are the facts?

The lifting power of an airship (lighter-than-air) follows from elementary laws of physics, and is the difference between weights of equal volumes of gas and air. For an airship of 5,000,000 cubic feet—which would be practically twice the size of the *Los Angeles*—filled with helium gas, the lifting power would approximate 145 tons or 310,000 pounds. The weight of the airship structure complete with engines but without fuel would be 40 to 50 per cent of this total lift, or say 65 tons, leaving 80 tons available lift for armament, fuel, ballast, crew and effects, provisions, spare parts, and cargo. About 70 knots would be the maximum speed of this airship, but to drive her at the more conservative and economical speed of 60 knots would require 2,000 horsepower. Airship engines require 0.55 pounds of fuel and oil a horsepower hour. This gives a round figure, approximately correct, of one ton of fuel and oil for each 100 nautical miles traveled by such an airship at 60 knots, which speed probably could not be maintained with airplanes attached.

U. S. S. *Langley.*

The ship would require a crew of at least forty, weighing, with their effects and provisions, five tons. To land successfully and be free to maneuver in a vertical plane, an airship must carry ballast. The higher the expected altitude the greater the quantity of ballast required. For an ordinary flight of such a ship, at low altitude, probably five tons of ballast should be carried.

These figures indicate that under the most favorable conditions, carrying only the crew and a minimum of ballast, we get a possible distance traveled at 60 knots of 7,000 miles. *But this is without airplanes or armament.*

Bombing airplanes fully loaded with a crew weigh three to five tons. Pursuit planes weigh 1.0 to 1.5 tons. Assuming the special construction of light-weight airplanes for these airship carriers, we may state the weight of a bombing plane as, roughly, three tons, and that of a pursuit airplane as one ton.

An editorial on this subject stated that such a ship could carry 30 bombing airplanes and 150 pursuit airplanes. Thirty bombing airplanes and 150 pursuit airplanes would weigh at least 240 tons—just three times the weight the airship can possibly lift from the ground. (This is omitting fuel, crew, or ballast.) The airship could not even rise from the ground with the load stated.

Suppose she could rise from the ground, and these airplanes should be released, the lightening of the load would cause the airship to shoot straight up until gas was let out sufficient to correspond with the load released, and then when the airplanes sought to return the airship would not contain sufficient gas to hold them in the air.

Our problem of national defense lies not simply in defending our shore line and coast shipping for 200 miles at sea. Our problem starts immediately the enemy leaves its home waters. As I have pointed out, airplanes could not cross the ocean under their own power with an effective military load, therefore, we must intercept and destroy the *airplane carriers* before they get within striking distance of our shores. Further, our defense problem is not simply a continental problem. We have island possessions. We have the Panama Canal. In going to the Canal our airplanes could not fly over neutral territory; they would be compelled to take to sea, where they would again be at the mercy of surface carriers for fuel, supplies, landing, and so on.

An enemy should never be allowed to approach within 200 miles of our land, so it is a grave error to base our defense plans on weapons that will not be reasonably effective at that distance.

Some argue that it is a waste of time and money to train an aviator in the knowledge of ship duties. An aviator does not need to know how to run a battleship, they say. There is this to consider: if an aviator is soaring above a fleet "spotting" shot for the commander-in-chief, and advising him what to do, he certainly needs some knowledge of naval warfare. Imagine the "eyes of the fleet" trying to direct gunfire without any knowledge of the maneuvers of the fleet below him and what they signify! The naval aviator should be able at a sweeping glance to interpret the maneuvers of his own fleet as well as that of the enemy. Further, it must be remembered that a naval aviator spends comparatively little time in the air: most of his time is spent aboard ship. The naval aviator has other duties and is as much a part of the crew as the rest of the officer personnel of the ship. Further, he is a part of the Navy and devotes his loyalty to the Navy. There is no division of interest to impair his efficiency. He is a part of the fleet.

Much has been said about the independent air service of Great Britain. According to our best information, it does not seem to be working out with satisfaction, and is meeting with a great deal of criticism not only among British subjects, but among the officer personnel of the British navy as well. Even if the independent air service were successful in Great Britain it would not mean that it would work satisfactorily in the United States, because of the fact that the British Isles lie within easy striking distance of land air forces of practically every European capital. Their air problem is therefore more of a land problem than is ours. America's air defense problem begins as a naval one as before pointed out. A division of responsibility and methods of technical training in a sea engagement might prove just as disastrous to our fleet as it did to the Spanish Armada when they manned their ships with soldiers and attempted to let the soldiers do the fighting while the sailors maneuvered the ships under the orders of soldiers.

The world flight made by army aviators demonstrated beyond argument that seagoing aviation is dependent on surface ships. In addition to supplies transported by merchant ships and to the assistance rendered by Coast Guard vessels there were one or more ships of the Navy assisting during 128 days of the flight. *In the aggregate, 33 ships manned by 339 officers and 5,062 men had some part in this service.* The aggregate distance steamed was 136,566 ship miles. The total fuel thus used by the Navy was 6,299,941 gallons. It is a fair assumption that if the same flight were made again, approximately the same precautions and the same service of surface ships would be required.

McGuffey's Maxims

Little Tales of Conduct From the Famous School Reader of the Last Generation

THE SLUGGARD

1. I WENT by the field of the slothful, and by the vineyard of the man void of understanding, and, lo! it was all grown over with thorns.

2. Nettles had covered the face thereof, and the stone-wall thereof was broken down.

3. Then I saw and considered it well. I looked upon it, and received instruction.

4. Go to the ant, thou sluggard. Consider her ways, and be wise. She, having no guide, overseer, or ruler, provideth her meat in the summer, and gathereth her food in harvest.

5. How long wilt thou sleep, O sluggard? When wilt thou arise out of thy sleep?

6. Yet a little sleep, a little folding of the hands to sleep. So shall thy poverty come as one that traveleth, and thy want as an armed man.

7. 'T IS the voice of the sluggard: I hear him complain,
"You have waked me too soon, I must slumber again."
As the door on its hinges, so he on his bed,
Turns his side and his shoulders, his feet and his head.

8. "A little more sleep, and a little more slumber,"
Thus he wastes half his days, and his hours without number;
And when he gets up, he sits folding his hands,
Or walks about idly, or trifling he stands.

9. I passed by his garden, I saw the wild brier,
The thorn, and the thistle, grow broader and higher;
The clothes that hang on him are turning to rags;
And his money he wastes, till he starves or he begs.

Time to "Get Into the Air," America!

Concluded from page 5

airplane which can quickly reach inaccessible regions. In the conservation of forests the airplane has displayed its usefulness. The Department of Agriculture has investigated the distribution of wheat rust spores and this is of interest to the farmer. It has fought the gypsy moth in the forests. It is fighting the grasshopper in the Philippines and crop reporting by airplane has been demonstrated. The Bureau of Fisheries has shown how schooling fish may be located by the air and radio. The Coast Guard, which has authority for an air service but no appropriation, wants to use the airplane for the benefit of commerce, in reaching vessels in distress, life-saving, locating derelicts, furnishing medical aid, and in the enforcement of the laws. The Bureau of Mines has been sending its experts by aircraft to the great mine disasters. Nearly every branch of the government comes into contact with aeronautics and many have made every possible use of aircraft.

The airplane has been used in the inspection of power lines. It can rush repairs and men for emergency work on telegraph or telephone wires. Mosaics are wanted of irrigation, reclamation and mining projects, of oil fields, proposed railway lines, in city planning and suburban development.

There are so many varied and scattered demonstrated applications of both airships and airplanes that it is futile to attempt accurately to estimate their possibilities. Every activity in which aircraft engages is followed in its train by incidental sub-activities.

The first line of defense of any country is by way of the air. Every airplane or airship put to a commercial use adds to national security, for each is a craft that immediately, without great change, may become an instrument of warfare—while as an instrument of peace it supersedes all other methods of personal communication.

Business needs the airplane.
Get into the Air, America!

"Wild Turkey, the Vanishing Bird"

By E. R. GAMMAGE

WILD turkey, the noblest bird of which Americans can boast, is now becoming almost extinct, along with some of the other invaluable treasures which abounded in this wonderful country of ours when it was first discovered. It was prized by the Indians long before white man set his foot upon American soil, and our forefathers considered it one of the blessings which God bestowed upon them to help them through their first hard winter in the new land and it held a place of honor on their table on that first memorable Thanksgiving day. It is difficult to believe that we, as loyal Americans who revere the memory of those first pioneers, could have so thoughtlessly allowed this wonderful bird to have been so wantonly destroyed when, with a little forethought and care, it could have been preserved in abundance for ourselves and our posterity. But such is the case and it is now only a fortunate few who can boast of ever having even seen a wild turkey.

When I was a small boy, wild turkeys were plentiful in East Texas and I can remember having seen hundreds of them on the mountain sides, and at one time I slipped up to within one hundred feet of some of them before they flew away. At that time, I had a worthless dog which I called "Catch," because he was foolish enough to try to catch everything I told him to. One day I pointed out a big gobbler and told "Catch" to get it, so he started after it and I after him. The gobbler had had his wing broken and could run only a short distance at a time but even then he kept us going for half a day and when at last we did get him we were seven miles from home. Needless to say how much a ten-year-old boy enjoyed lugging that fifteen-pound turkey all the way back home.

There are several subspecies of wild turkeys in Texas, in Florida, and on the southern borders and they sometimes interbreed with our domesticated turkeys. They were introduced into Europe in the sixteenth century.

The turkey of Central America excels all others in its various colors and magnificent plumage which combines metallic, green, blue, black, yellow, and red. It lives in the open country and forest rather than in the deep forest, as does the wild turkey of North America. The male bird has no tuft on the neck and the adults measure about forty-eight inches in length. The wild turkey can be distinguished by the chestnut, instead of white, tips on upper tail coverts and tail. They roam about in droves of from six to fifteen, roosting in well-wooded bottom lands in a chosen rendezvous.

In March, the males begin to gobble and then many a battle is fought to determine who shall be leader of the flock or the sultan of the harem. While the mother turkeys are brooding or caring for their young, the males are pushed away to enjoy each other's company.

The mother bird makes her nest on the ground and conceals it as well as possible but takes the added precaution of covering the eggs when she leaves them in search of food. She lays from nine to eighteen eggs and they average 2.55 by 1.80 inches in size and are a rich, dark-cream color, thickly sprinkled or finely dotted with round spots of brown and umber.

E. A. McIlhenny and Chapman have written some excellent books on the wild turkey and have illustrated them with most interesting photographs.

Reaping the Whirlwind in North Africa

"I WAS in Morocco, all over it, including a spell with the Spanish army in the Riff hills for a large part of last year. In a month or so, I shall be returning, and may go along to Tunisia, where I was through most of 1923. My own private view is that things are working hotly for a great upheaval along the whole of North Africa. I was deeply impressed by what I found in Morocco."

So writes a well-known writer and traveler to a representative of this paper. To any one who knew Morocco in the days before the coming of the French, when the country was innocent of highways and railroads, when, in place of the present magnificent harbor at Casablanca, for instance, was nothing but the immemorial water gate and slipway of every Moorish coast town, to anyone who knew Morocco in those days, the statement quoted above must have a significance all its own.

It was Lord Curzon who said many years ago, "Drop a stone into the pool of Islam, and, no matter how long it takes, the ripples will travel to the farthest shore." For the last fifty years or more, Europe has been dropping stones into the pool of Islam in North Africa. First came the French in Algeria; then the British in Egypt; then the French again in Tunisia; then the Italians in Tripoli, and, lastly, the French and the Spaniards in Morocco. With each onslaught the eddy has grown stronger, until today a veritable wave of revolt is surging back and forth between the Red Sea and the Atlantic.

The fact is that although the government of backward races may be a necessary business in international development, it is always a difficult not to say dangerous business. It is, moreover, almost always a thankless business, and can only be undertaken with any promise of ultimate success in the spirit of real disinterestedness, such as actuated the best American statesmen in the Philippines and the best British statesmen in Egypt and India. Even then the road is always rugged and thorny. There is a story told of a certain British general, who, having been sent on a punitive expedition against a small tribe on the northwest frontier of India, dispatched this cryptic message to the war office in London—"Bunchu is hell, but the Bunchus like it."

The trouble is that the Bunchus always like it, and nowhere have they liked it more devotedly or resented disturbance more vigorously than in North Africa. Particularly is this the case in that storm center of the last fifteen years, Morocco. And why? Because, in the case of Morocco, more than in any other North African country, is the existing settlement rooted in fear and intrigue. Fifteen years ago, Great Britain acquiesced in the establishment of a French protectorate over Morocco in return for France's full acceptance of her own protectorate over Egypt. She made one reservation, however, namely, that Spain should be given the great tract of country known as the Riff, immediately across the straits from Gibraltar. Great Britain did not want France as her neighbor, and so the whole thing was arranged in the interests of "the high contracting parties," and the Bunchus were left out of it.

From the very first there was trouble. Spain has no genius for administration. The Spanish Zone, as the Riff was called, quickly became a cave of Adullam for all who desire to plot against France, and during the war it was a veritable hotbed of German intrigue and a thorn in the side of all the Allies. Today, after the expenditure of great treasure and many lives, Spain is withdrawing, and the Riff is apparently to be allowed to sink back into "the changeless calm of the changeless East." Can it be allowed to do so?

The question is not an easy one to answer. Europe has been sowing the wind in North Africa through many decades; it looks as if, in this decade, unless something is done, some move of real adjustment and statesmanship is made, she may reap the whirlwind. Perhaps the League of Nations may prove itself big enough and vital enough to come to the rescue. If it does, and does so successfully, it will have done much to establish its influence, and to win converts among those who are still skeptical as to its real sanction and authority.

Shrimps and Shrimping

THOSE epicureans who delight in eating shrimps may wonder how and where they are caught.

The shrimp itself is a small crustacean, having a slender body, long legs, and a depressed abdomen. Some of the larger species are nearly as big as lobsters. These larger ones grow in the West Indies and Central American waters. In northern waters, they are smaller but the larger of the northern shrimps are awkward creatures to handle as they are armed with long, sharp, saw-like spears with which they are able to inflict bad injuries upon the hand of the careless fisherman.

The shrimps, in their native habitat, are really active and graceful, and are so nearly like their surroundings that it is very difficult to see them when they are at rest. In the shallow pools they are so active that it takes an alert fisherman to net a catch. Where fishes which eat them are plentiful, the shrimps hide during the day and wait for their food until night. They excavate holes in the sand with their hind legs, sinking part of the body into the hole thus made and throwing the sand over themselves. They undergo the molting process as do crabs and lobsters.

In England shrimp fishing as an industry has assumed immense proportions. In the Thames, below London, the shrimping boats present a scene of intense activity. The boats themselves average forty feet in length and have high bows and sheer-line sweeping rapidly downward toward their square sterns. A low freeboard aft is necessary for proper working of the trawl.

In drawing up the trawl, a large wooden winch is used; the warp is passed round the drum, and the mate winds it up while the skipper coils the slack down. The catch is spread out on the deck and sorting is proceeded with at once. Crabs, seaweed, unedible fish and other articles go overboard in a cascade. Sizeable fish are tossed into a receptacle and the shrimps themselves are divided into two heaps. One heap consists of brown shrimps, the other the pinks. The skipper sifts the undersized shrimps through the holes of a circular sieve while the mate pours water from overside on them to wash them. The small shrimps are returned to the sea after passing through the holes of the sieve. The size of the mesh in both the net and the sieve are legally determined and woe to the fisherman who is found with a smaller mesh than that proscribed by law.

The shrimps are cleaned and boiled in sea-water at once and when cooked they are ladled out of the boiling water with a hand net and are spread out to dry on a fine-meshed net spread horizontally. The dried shrimps are then packed in baskets, tied and labeled, and are sold to the trade when the boat reaches home.

How Washington Capitol Was Built

Concluded from page 11

quarrel with Thornton, and was compelled to resign the position. James Hoban, the architect of the White House, then undertook to complete the north wing, which he accomplished in 1800.

The construction of the south wing and the remodeling of the north wing, which had been very poorly constructed, were placed in the hands of Benjamin H. Latrobe, recently come from London, where he had had unusual advantages in the study of architecture. He was given ample authority and power by the commissioners, and completed the work in 1811, in harmony with his own plans. He then linked the two wings by a large wood bridge which traversed the space now occupied by the Rotunda.

Sandstone taken from quarries on an island in Acquia Creek, about forty miles below Washington, was used in building the walls of both wings; bricks manufactured in kilns erected on the Capitol grounds were used on interior work; lime was secured in the vicinity of Washington; skilled and unskilled labor was secured at Philadelphia, and other points; the necessary hardware was obtained only after great inconvenience, trouble and expense from wherever it could be had, as there were no large stocks of specific articles in any city in the country.

The end appeared to be in sight, however, when Latrobe turned over the job in 1811 completed as far as it was then possible to do.

Then, during the evening of August 24, 1814, the British troops invaded Washington, burned the Capitol, the White House and other public buildings and many private homes.

At the time this occurred, Latrobe, the actual architect of the Capitol, was in Pittsburgh, helping to build a steamboat for a man named Robert Fulton. Upon being immediately recalled to Washington, he made careful investigation as to the results of the fire on the Capitol. He reported that the walls and foundations were not injured, and that restoration of the structure could easily be accomplished. With great diligence he proceeded with the work of restoring it, and upon which he labored until 1817, at about which time he resigned.

Charles Bulfinch, an architect from Massachusetts, succeeded Latrobe and for ten years applied himself to work on the Capitol, following the designs and plans of Latrobe. He informed Congress in 1827 that the Capitol was finished.

Latrobe's major architectural contributions were the old hall of the House of Representatives, now Statuary Hall; the old Senate chamber, now the United States Supreme Court's chambers, the Law Library quarters, and the old lobbies. Bulfinch completed the wings, linking them by means of the central rotunda, with a low dome. He also constructed an important portion of the Library of Congress, which was in those days housed in the Capitol.

At that time, the edifice occupied approximately one and one-half acres, was three hundred and fifty-two feet long, and one hundred and forty-five feet to the top of the dome. The construction cost up to that time amounted to nearly $2,500,000.

At the end of about twenty years, the membership of the Congress had so increased that an enlargement of the Capitol became necessary, and in 1850 it was concluded to "extend the wings by greater wings, called extensions." These were to be of marble and linked with the original Capitol by ample corridors.

Thomas U. Walter, an architect of Philadelphia, was appointed to do the work, which continued him in the position until 1865.

The cornerstone of the House extension, the south wing, was laid by President Fillmore on July 4, 1851. An oration was delivered by Daniel Webster, Secretary of State. The ceremonies, like those of forty-eight years before, when President Washington laid the cornerstone of the original Capitol, were under the auspices of the Masonic Order, the Grand Master of the Grand Lodge of Masons of the District of Columbia wearing "the regalia worn by President Washington" on the former occasion.

November, 1867, saw the completion of the extensions and other alterations. The new dome required nine years to construct—at a cost of $1,250,000. Approximately $10,000,000 was spent in the reconstruction of the edifice, which, added to the cost of the original structure, made the total expenditure approximately $13,000,000.

The Capitol covers considerably more than three and one-half acres; the Capitol grounds comprise about forty-five acres; the total length of the building is 751 feet and 4 inches; including porticoes, and steps, its width, or depth, is 324 feet.

This magnificent structure, whose wonderful and beauteous artistic character has drawn from the pens of competent critics more adulatory praise than, perhaps, any similar edifice in the world, and which has been acclaimed one of the world's masterpieces of gigantic architecture, had its simple and modest beginning in the following specifications set forth in the advertisement in 1792: "A conference room, a room for representatives, sufficient to accommodate 300 persons each; a lobby or ante-chamber to the latter; these rooms to be of full elevation, 12 rooms of 600 square feet area each for committee rooms and clerks' offices to be of half the elevation of the former."

Judging from the throngs of sight-seeing visitors that daily surge through the Capitol, month in and month out, year in and year out, regardless of whether Congress is in session, it is not difficult to receive the impression that practically everybody in the United States has inspected the interior of the Nation's pride. It abounds in works of art; paintings large and small, depicting early historical incidents in America; statuary, good, bad, and indifferent; mural decorations of highest artistic value, which have never been completed and probably never will be.

Nurmi, Record Breaker of Records

World's Swiftest Runner Conquers, Comes, Sees, and Conquers Again

By PAUL MACDONALD

IT SEEMED sheer folly to try. It simply could not be done. There was something about an invasion of the United States that crushed the invader. Why could not Paavo Nurmi read the history of international sports' competition within the last three years and gather his lesson from that? Why hurl himself into the face of the inevitable? Why could he not rest on the honors so brilliantly won in the Olympic Games in Colombes Stadium near Paris last July? Why not stay in his native Finland and retain the glory that he so firmly held? Would they never learn?

There was the history of international competition in recent years. Mlle. Suzanne Lenglen, most gifted woman tennis player on the other side of the Atlantic, the pride of France. She came to this country, failed completely, and left nothing but a bad impression and a record of defeat. Georges Carpentier, the only talented ringman that France has produced, holder of the heavyweight championship of Great Britain and the Continent, came to the United States and was crushed by the American Jack Dempsey. The women tennis stars of Great Britain came to this country and lost. England sent her best amateur golfers to America to compete for the Walker cup. They lost. Great Britain sent her representative polo team here and the British four met humiliating defeat. And, as with men and women, so with horses. First, the British turf star Papyrus engaged in a match race on this side and lost. Then there arrived Epinard, king of the French turf, engaged in three match races on this side and failed to finish in front once. A hoodoo attached itself to foreign competitors in this country, that seemed certain.

Why should Nurmi try? Being an amateur and wishing to continue as one, there was no money involved, no large purse that would soothe his feelings if he failed. He had no financial guaranty. If he failed he failed completely and dimmed the glamour that was his after his Olympic Games' victories. What made it seem more foolhardy was that Nurmi would have to run indoors, on board tracks. He had never run indoors. In Finland, where he trained and ran nearly all his races, it was always outdoor running. There is a vast difference between outdoor and indoor running. Even those used to indoor running can never do so well indoors as they do outdoors. Furthermore, indoor running reduces a man's ability for outdoor running; it affects the legs.

Nurmi was, therefore, going to a strange country, into a strange climate, under strange conditions to try to prove himself the world's greatest distance runner over board tracks indoors. He was going to do what no invading athlete had been able to do in years.

That was all late last autumn. Since that time Nurmi has made the trip across the Atlantic and has made his début indoors and the newspapers have told you the result. Nurmi, who had never before been on boards, smashed record after record, running into the ground the pick of American distance men and some of his fellow countrymen who had preceded him to the United States and already proved consistent winners on this side. Nurmi smashed marks that had stood for years, records that seemed safe even from Nurmi indoors. His career, under roof and electric lights, was one record-wrecking performance after another. On a Thursday night he ran in New York, on a Friday night in Chicago and on Saturday night he was back in New York. Three meets in three nights. Two long railroad jumps between meets. And one or more records broken in each meet. Nurmi not alone proved himself superior once but he did it every time he stepped on the boards, proving conclusively that starting from scratch there is not a man in the world that can run with him.

Since Nurmi's first race in the United States I have heard several opinions advanced by track experts that Nurmi, while the best in the world today, could not have beaten several British and American professional runners that preceded him. The natural answer to these assertions is the records. But the sponsors of the cause of the old-time professionals are not stopped by that. They tell you that the professionals who used to run 25 and 30 years ago, and even before that, ran for money and not for records. Since they ran for money and since they tried frequently to bet on themselves, records were a handicap to them. It would be difficult for a runner to get a match if his record showed that he had covered a mile six seconds faster than his opponent ever ran the distance. Even if he got the match who would want to bet on the opponent? The professional who ran for money, therefore, tried always to run no faster than he had to run and still win. His object was always to prevent anyone from finding out how fast he could really run. For his own purposes it was always best to make each race as close as possible. The ideal ending to a race would be a tight finish that left the spectators convinced he had run his level best; leave them under the impression that the beaten man was unlucky and another race would find the result reversed. That meant a return match and since the professional was in the game to make as much money as possible the more races he ran the more money he got.

The explanation is logical. The professional runners wanted victories and not records. The reason is plain. Sometimes they were not so keen for victories. Some of them purposely lost. There were times when a runner found he could make a great deal more money betting against himself and losing than he could possibly make by betting on himself and winning. Crooked foot races developed. One day came exposure. More followed. Foot racing by professionals was killed as a sport.

Probably some of the old-time professionals could have run faster than they did. It may be true that there were faster men in the past than Nurmi. Maybe some of those that were never extended could have beaten Nurmi at their best. But the world will not judge by

(C) Wide World Series

PAAVO NURMI

supposition. The only proof lies in the record books and Nurmi, first outdoors and then indoors, has shrouded the performances of the past. Regardless of what might have been, Paavo Nurmi, the Finn, is regarded as the greatest runner of all time in the eyes of the world and in the record books.

He is a strange character, this Finnish phantom, strange at least to many of us. He is shy, reticent, retiring. He cares nothing for society. He is much of a recluse, a man who prefers his own society to that of others. When he went to Chicago, a great throng gathered at the depot to bid Nurmi welcome to the Middle West. The train pulled in but no Nurmi alighted. He had left the train at a suburban station and gone to the Coliseum by taxicab to escape the cheering mob of well-wishers. He does not attend banquets, or dinners, or parties. Social functions do not appeal to him. All Nurmi cares about is running and, even the disappointed social leaders must admit that he does that fairly well.

Since his performances in the Olympic Games last year Nurmi has been the most discussed athlete in the world. To receive all the publicity that has come to Nurmi the natural conclusion is that he must be an excellent showman. The strange part of all this is that Nurmi is no showman.

To prove how far Nurmi goes in observing the letter and spirit of the amateur rôle, Nurmi turned down an offer of $500 to permit his name to be used over a newspaper article. His refusal was cold, almost indignant. How many American athletic stars can say as much?

What makes Nurmi a great runner? Here is a man of normal athletic build. He is about 5 feet 10 inches tall and built like the great majority of other men of that height. He has ordinary arms and ordinary legs. There is nothing about him that would indicate his running ability. Place Nurmi among a thousand men and you certainly would not single him out of the lot, nor would you select him if he were among 100 or among 50.

Nurmi is great because he picked a goal, found the path leading to it and stuck to that path. That is the simplest explanation. He did not develop overnight but gradually. It took years and years of hard and consistent work to swing him to the top. It took the kind of training that few men have cared to undergo.

Running from 20 to 30 miles a day Nurmi prepared himself for the great test. He had been running ever since a boy and when he finally decided to develop himself into a champion runner he agreed to do the work demanded. He shunned alcohol and nicotine. He lived on simple foods. He never overate. He got enough sleep and learned how to relax.

The kind of running that Nurmi does cannot be accomplished as the result of a few months' training. It is the result of a steady grind that covers years. Long-distance runners must train differently from other athletes. Development is slow.

What brought world renown to Nurmi was his work in the Olympic Games when he ran the world's best milers into the ground in the 1,500-meters race. In the field was Stallard, pick of the British team. He finished 60 yards behind Nurmi. As he crossed the finish line Nurmi slowed down, grabbed his sweater from an attendant and ran off the field. Stallard, finishing next, fell in a heap as he crossed the line and several physicians worked over him more than 20 minutes before they could revive him. Nurmi had run every competitor to the ground.

Forty minutes later the runners were called out for the 5,000-meters run. Nurmi was entered in that. Nurmi appeared from his dugout, fresh and natty. Apparently he had just arrived. Nurmi jogged back and forth to limber up for the 5,000-meters finals. And he won the race as easily as he had captured the 1,500-meters run. He took the lead soon after the start and continued at a steady pace. His speed threw off every other runner but Willie Ritola, a star of the previous Olympic Games and running under the same colors as Nurmi at Paris. But Ritola, a great runner himself, could never catch the flying Nurmi, who seemed to float along the ground never increasing nor slackening his speed, ever running at the same steady gait. He finished as he had finished the 1,500-meters race, without an extra effort. All through the longer race, like in the one run 40 minutes previously, Nurmi moved like a machine, with perfect precision and pace. After he crossed the finish line he ran off the field, showing no sign of having done anything more strenuous than engaged in a brisk walk for a few blocks.

There has been nothing like this double performance in any other Olympic Games. Considering Nurmi's work in the two races and the close proximity in which they were run, he had established himself in a single afternoon. His best single feat came later in the 10,000-meters run. This was a cross-country race run under a blazing sun with the thermometer around 100. Again Nurmi showed the same pace and mastery of it and once more he finished fresh with Ritola landing second place and coming across the line long after Nurmi had trotted off the field. Ritola was more than 500 meters behind Nurmi when the winner finished. Almost every other competitor dropped out before the race was half over. Many of them fell unconscious. The blazing sun, the oppressive heat, and the pace had no apparent effect on Nurmi.

The secret of all this is that Nurmi did not run 10,000 meters in practice to train for a 10,000 meters race. He ran 30,000 and 40,000 and 50,000 meters daily. A man who runs three, four and five times the distance that he will be called on to race is not going to mind the distance of the race. Nurmi, running 20 and 30 miles a day, found a race of six miles little more than a jog.

By continuing along the lines that he has followed Nurmi will probably run even better in the future. He has been running since a boy and came to attention as a runner five years ago but it was not until within the last two years that he gave promise of doing big things in distance races. As I have said, distance runners develop slowly. They rarely do their best work before they reach the age of 30. Go through the records of distance running in Olympic Games' competition and you will discover that the best performances have been delivered by men between the ages of 30 and 40.

Nurmi's work in the Olympic Games of 1924 was remarkable but I believe that his work indoors in the United States was even more remarkable. Considering it from every angle there is really nothing in the athletic history of the world that can compare with it. Nearly always Nurmi was compelled to run under adverse conditions. He was in a strange land and under strange conditions. The food, water, atmosphere, everything was new to him and confusing. He had never run on a board track. He had never run under artificial light and indoors. He had to beat the greatest runners of a nation that was supreme in Olympic Games' competition. He rarely faced the same conditions in any two meets. Some of the tracks over which he ran were gradually banked and others had steep banks. Sometimes there was no pitch to the turns and the number of laps varied on nearly all of the tracks. But still he ran, breaking record after record.

What has been the result of Nurmi's performances? The government of Finland recently estimated that Nurmi had donated $10,000,000 to good will for Finland in the United States. Charles E. Mitchell, president of the National City Bank of New York City, and Leonard Astrom, Minister of Finland, concur in this estimate. The credit of Nurmi's native land has been greatly benefited by his work in the United States. Of course, he had the assistance of other Finnish athletes. Kohlemainen, Ritola, Stenroos, all Olympic Games' heroes, contributed to establishing a firmer place for Finland among the nations of the world. It naturally follows that a nation producing Nurmis, Ritolas, Kohlemainens, Stenrooses, and their kind, must be a sturdy and progressive country. They have advertised Finland to the world and made the world interested in the mother country and her products.

He has done something for the United States as well. He is creating a new interest in track and field athletics. He is inducing young Americans who would not walk or run otherwise to do that very thing. He is setting an example, the value of which cannot easily be measured. And, if I may add the observation, he is showing us something in the way of amateurism and sportsmanship.

BRIEFLY TOLD

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. The set includes: "The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

"I Read in the Papers—"

I read in the papers that Abby Rockefeller will marry "a struggling lawyer," and I am properly impressed. Most sincerely do I trust that the reporters are giving us a true fairy story. But I will believe it only as the lawyer keeps on struggling and makes his own way. It is in so much better taste than marrying a lounge lizard, so much more moral somehow than a marriage joining fortunes would be, that people just naturally hope that the bride's family will not go and spoil it all by relieving the young man of any of his struggle. That is the way it should be in America. Just as brains are always coming up from poverty to wealth, so brains ought always to be going from wealth into poverty, until all phases of our life become leavened with ability. Living on a small income would be the preferable way to live, if we only knew how. It is a far more comfortable way to live, if we only knew how. The very best life now lived in this country is the plain common life, but if it were more marked by good taste and dignity, it would be a life without peer.

I read in the papers that King Alfonso of Spain is experiencing a very favorable reaction from the Ibanez attacks. And it bears more than the earmarks of a manufactured hurrah. The people of Spain, not only, have expressed their attachment to the royal family, but in other countries the voice of confidence has been raised. For example, Dean Inge, of St. Paul's, London, has come to the front with an explanation of the king's treatment of the scholar Miguel Unamuno, which must be credited. Uanmuno's base and unfounded references to the character of the Queen were of such an exasperating nature that his polite banishment must be regarded as an act of mercy rather than of autocratic oppression. Poincaré has testified to Alfonso's neutrality during the war with a leaning of benevolence toward the Allies. But the Directorate still continues, and may for 20 years more. A little while ago the Directorate seemed to be in the throes of trying to find a place to let go. The new policy seems to have been a bold appeal to the people, and the people appear to be satisfied.

I read in the papers the withdrawal of the United States from the opium conference. It is a great pity that the facts about this matter are not more generally known. The United States, pilloried the world around as being the most "materialistic" nation, went into that conference with the straightforward proposal to limit the production of opium to the medical needs of the world. Our representatives fought with consideration and wisdom, in the shadow of the very League of Nations itself, for a moral reform sadly needed in this world. With what result? They met with a double-dealing and insult. Lord Cecil, upon whom the professional pacifists of the United States shower compliments and money, was the chief obstacle to any settlement, and his last proposal would have insulted professional crooks. The "materialistic" nation, upon a straight test, proved more idealistic than the nations that deride us. And we let ourselves be derided, that's the curious thing!

I read in the papers a great deal about the air fracas. Outside the printed accounts, I have this information: Since June 30 last year navy airmen have made 53,000 flights. During that time there were 112 accidents. Thirty of these accidents were due to failures of material, and 25 of the 30 were due to engine failures. There is a total enlistment of 3,482 in naval aviation. This includes 358 pilots, five observers, 15 students, and 15 under flight orders. The Navy recognizes the hazardous nature of flying by granting those under flight orders 150 per cent of the base pay of naval officers. Any facts are welcome in the blizzard of conflicting statements.

I read in the papers that Soviet Russia is in trouble again. The stoppage of private enterprise has resulted, naturally, in a stoppage of business. Freedom to transact business one with another is one of the inalienable rights of the people; liberty to trade is part of liberty itself; but the Soviets don't see it. I never understood that passage in the Bible—"for this cause God shall send them strong delusion, that they should believe a lie"—until I studied Soviet Russia. It seems borne out by history that no contributions have ever been made to economic knowledge or political freedom by men who denied God. That denial seems to abstract the essence of right thinking from all forms of intellection. This Great Denial leads to every other, until the system built upon it becomes a vast lie. And the only way to remove such a lie from the earth is to let it mature, let it reach its logical development and burst with the fullness of its iniquity. That is what is transpiring in Russia. The delusion of the lie is there, and Destiny seems to have delivered the responsible heads completely over to it.

I read in the papers the story of Lawrence Tibbett, American, whose excellence compelled an ovation at the Metropolitan. There is always a joy in hearing of another man's success. This man wanted to sing. And taking the thronged road of ambition, he met the thousand pin-pricks that test people who try that road. Then came Opportunity, and though he was not ready for it, he buckled in. Then came success. They didn't know it was Tibbett the audience was thundering for. Tibbett himself didn't know, until all the stars had gone to take the curtain call. He, journeyman-singer that he was, had just casually noted it as part of a star's due. And then a messenger came back stage telling Tibbett that he was the cause of the thunder. And he went out in a daze. And the first person he saw was his wife standing up, clapping her hands and crying. I'll say that's success, when your own wife goes to pieces over your work. If Tibbett is never heard of again, he has scaled the apex of success.

Thomas A. Edison Tells About the "Little Peoples"

Do You Know the "Little Peoples"?

Edison Says They Are Minute Intelligencies That Act as Memories

By ALLAN L. BENSON

This is the second talk with Mr. Edison. The first appeared last week.

"HOW do we remember?" I asked Edison. "Well, now let us see," he began. "In the first place, we do not remember. A certain group of our little people do this for us. They live in that part of our brain which has become known as the 'fold of Broca.' Broca discovered and proved that everything we call memory goes on in a little strip not much more than a quarter of an inch long. That is where the little people live who keep our records for us."

The older Edison becomes the greater seems to be his interest in what he calls the "world of the little peoples." The "little peoples" in your body, for instance, are the minute intelligencies that constitute the cells of which your body is composed. In your body there are billions of such intelligencies, each an expert in its own field, but knowing nothing about anything else. Some of the little peoples that compose your stomach-cells, for instance, can perform miracles of chemistry that no chemist can perform, but you would drop dead if they were to jump into your heart and try to function as a pump. A few million intelligencies have nothing to do from the time you are born until you die but to act as your memory. Such, at any rate, is Edison's theory of what you are and how you work.

"Some of the little peoples who enable us to remember things," he continued, "do nothing else during our entire lives but watch moving picture shows. Everything that comes in through the eyes comes in the form of moving pictures. These pictures come so rapidly that, like the pictures on a screen, they seem to be but one picture, but in fact they are millions. The optic nerves bring the pictures through the small holes in the front of our skulls into our brains where the little peoples whose function it is to remember can see them. We do not remember everything we see because everything is not worth remembering. Little Peoples, like 'big peoples,' are of various degrees of intelligence. Some will choose to remember what others will choose to forget. But whatever their intelligence, they all seem to be impressed by the startling and the unusual. The thing is remembered that makes an impression. When a human being is young and his little memory-people have empty record cases, many things make an impression. That is why so many childhood memories linger throughout our lives."

Seeing With the Eyes of Childhood

Edison then told a story to illustrate the tenacity of childish memory.

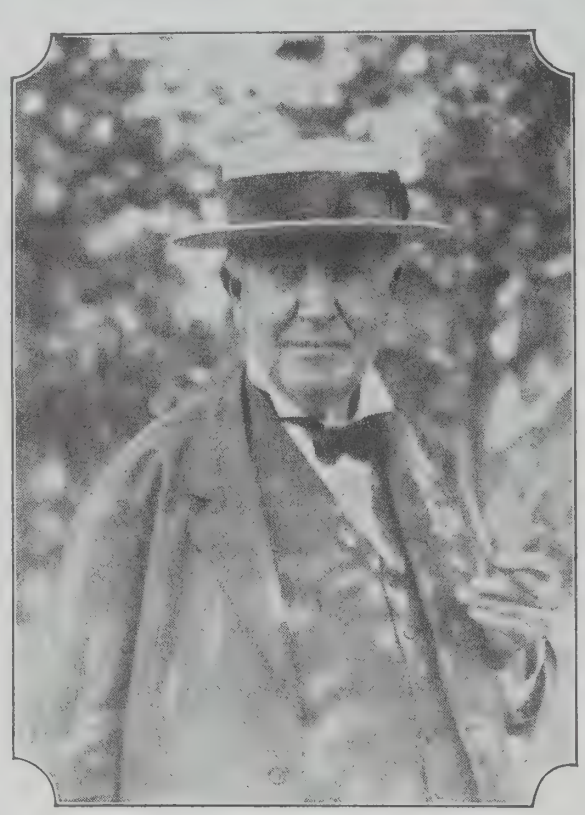
"A man was here the other day," said Edison, "who had recently visited the old country schoolhouse where he was a pupil when he was five years old. He told me that as he approached the place everything seemed much as he had left it almost half a century before: the hill down which he used to coast had somewhat flattened out; it was not the little Matterhorn, the memory of which he had carried with him so many years, but a very gentle slope. As he drew nearer the little building his mind was flooded with memories; this thing, that thing, and the other thing—there they were just as he had left them. But when he approached one of the side windows and looked into the room where he learned the alphabet, he got a great shock. Something was wrong with the windows! They were too low. As he looked through the little panes of glass he became distinctly uncomfortable. What was the matter? Then the answer came to him. The last time he had looked through that window he was so short that he had to grab hold of the sill to pull himself up. He had grown so tall that his eyes were perhaps three feet above the sill.

"Now see what had happened. For more than forty years some of the little people in this man's brain had carried about with them a certain recollection about those window sills. The recollection was that the sills were so high one could not look through the windows without pulling himself up. Waking or sleeping, wherever he went during those forty-odd years, that recollection was with the man, though he did not know it. During this time, the substance of his body, including his brain, had changed several times, but the little peoples that live in the cells had not changed. The moment the little peoples in that man's optic nerves began to see moving pictures of those old window sills and sent the message back to the brain, some of the little people in the fold of Broca began to stir. They had heard about those window sills before. They were so high that nobody could look through them without pulling himself up!"

What a Good Memory Really Means

Edison does not believe that all of the memory little peoples remember the same things.

"There may be twelve or fifteen shifts," said he, "that change about and are on duty at different times like men in a factory. I infer this from the fact that we sometimes have to send for the particular ones that have the records we want. That is what we do, I think, when we cudgel our memories for the things we want to recall. We have forgotten a man's name, for instance. We ask the shift of little peoples who happen to be on duty, 'What is that man's name?' They were not on duty when the name was given to them to remember and they don't know. After a while, suggestion or something else summons the shift that has the name and they give it. I therefore take it that the possession of what is called a good memory really means the possession of the ability to summon the particular groups of little peoples who have the records we want. Haven't you noticed that when you get in touch with the right group the thing you want to recall comes crashing into your consciousness with no evidence whatever of impaired vitality? The little peoples, who have remembered perfectly, seem almost to shout at you the information you want. Therefore it seems likely that remembering a thing is all a matter of getting in touch with the shift that was on duty when the recording was done."



THOMAS A. EDISON.

What a host of little peoples record and hold the things we wish to keep on file in our minds! Edison himself seemed almost awestriken at the contemplation of the probable number

Believes Little Peoples Are Immortal

"Why there are 125 million little strands," he said, "in the thing we call the optic nerve. Each of these strands is a mass of cells and each cell is a mass of 'little peoples.' There must be billions of them!"

Edison believes these little intelligencies—these little peoples—are immortal; that they go from one body to another and never die. He says it "does not stand to reason" that the individual is immortal, because the individual is but a collection of minor intelligencies, all of whom may never again be quartered within a single body.

I asked him why these little intelligencies thought it worth while to spend an eternity in a succession of human bodies?

"Just to get experience," he replied. "They seem to crave experience. As I see it, something like this happens: Millions or billions of little peoples, perhaps, come together in a certain individual. Some want to do one thing and some another. Some have high ideals and some have not. For a while, they fight out their differences and then the stronger group takes charge and this group dominates the man's life. If the minority is willing to be disciplined and to conform there is harmony or at any rate something that approximates it. But oftentimes the minority is not willing to conform. It is outraged at what it conceives to be the indignities that the majority heaps upon it. Minorities then sometimes say, 'To hell with this place; let's get out of it.' They refuse to do their appointed work in the man's body, he sickens and dies, and the minority gets out, as does too, of course, the majority. They are all set free to seek new experience somewhere else."

Edison, like Lincoln, Washington, and some others, sometimes says "hell" when he wants to get a lot off his mind in an instant.

I asked him if, in his opinion, memory-cells carried recollections from one human life to another. The first sentence of his answer showed that, however much he may doubt that immortality is in store for the individual, he would be glad if he could believe it.

"I should like to think so," he said after a pause. "I should like to think that the recollections of experiences in one human life are carried forward through an endless succession of other lives. If the same little peoples were forever grouped together we should then have immortality and, what is perhaps more important, we should be able to begin each new experience with all the wisdom that we had gained during the ones that preceded it. This, however, is not what happens. Each generation is not able to profit from the mistakes of its ancestors. Each generation commits most of the same follies that have been committed since the beginning of time.

"Nevertheless, I believe that some of our experiences are carried forward into succeeding generations. How else shall we account for what we may call inherited wisdom? Put your finger in a sleeping baby's hand. What does the baby do? It closes its hand on your fingers. Why? Because some of the little peoples in this baby remember the time when their forefathers lived in trees and it was necessary, to keep from falling and breaking their necks, to close their hands upon the limbs of trees.

"What we call 'inborn traits' are recollections of earlier experiences that the little peoples have brought along with them. Take an Indian baby, for instance. No matter how hard or how long you may try, you can never make a white man out of that baby. The little peoples in the baby will not permit you to do so. They have their ideas, gained from preceding experiences, of what a human being should do. You may repress these little peoples to the point where you believe you have made an Indian into a white man, but, when you least expect it, they will jump out at you and startle you with a war whoop. Of course, what you do to the red little peoples will constitute part of the recollections that they will carry on into their next life-experience; and when there have been enough such experiences the Indian's 'inborn traits' will have been changed.

"That is about the way I look at it. I do not see how there could be any such thing as carrying from one person to another the bulk of the recollections that the little peoples have as they go along. These minute intelligencies that carry our records would become so burdened, if they did not forget most of their experiences, that they would have no further capacity for memorizing. And inasmuch as the same little peoples never reassemble in another body, there can be no such thing as the perpetuation of the individual in another earth-life. Such things can happen, as they say, 'only in the movies' or in literature. Rudyard Kipling, in one of his best stories, had a London bank clerk get a glimpse of a former incarnation when he was a Greek galley slave. That was literature, but it was not science."

The Bank Clerk Who Was a Galley Slave

The wonder of the world appears to grow upon Edison as he himself grows older. Some minds naturally go out to the big things of the universe—the suns, the planets, the great constellations and the great spaces—but Edison's mind seems to go out to the infinitely little; and nothing seems so little that it does not disclose life. He spoke with awe of the fact that when New Hampshire granite is ground up and placed in water, minute particles of life appear upon the surface; particles of life that for perhaps hundreds of millions of years were locked up in the granite.

The mystery of life is even more of a challenge to Edison that it is to the ordinary man. For almost twenty years I have listened to him, from time to time, as he speculated upon it. Always he has reminded me of a man walking around an object, to view it from every angle. He seems to go about his philosophizing as he does to make an invention. He experiments with ideas as he does with materials. I suspect that he sometimes tries out opposing ideas to ascertain which one he can most successfully defend. Lincoln used to do this in politics. Before he became finally committed to anything he used to try to see how good an argument he could make against it. A few years ago, Edison told me he thought there was so little life-force in the world that it could not accept more than a fraction of the opportunities for its expression. The other day he told me there was probably ten times as much snake-life force in the world as could find means of manifesting itself. I do not know whether he meant that snake-life is so preyed upon that it finds difficulty in getting on the map, or whether he is experimenting with a new concept pertaining to the volume of life-force.

Life a Force Flowing Into a Mold

Edison has an entirely original concept with regard to life. He sees it as a force that flows into a mold and functions according to the mold. He says a seed, or an egg which is but another name for a seed, is wholly without life and is nothing but a blue print. Life-force flows into the seed and manifests itself according to the plans and specifications laid down. If the seed be that of a chicken, the life-force soon arrays itself in feathers and begins to cluck or crow. If the blue print was laid down by a flower there comes another flower. It was with this theory in mind that Edison, a few years ago, conceived the idea of a deficiency of the amount of life-force available to this planet. He said the earth would long ago have been smothered in codfish if there had been enough life-force to convert all of the eggs into fish. Luther Burbank, however, does not agree with Edison that seeds are merely blue prints, having no life.

Perhaps the most amazing demonstration that Edison or anybody else ever gave of this power took place a few years ago. Edison spent a day going through his cement factory. He took no notes on paper, but the next day he dictated a list of 600 things that he wished done to the machinery and fixtures, in each case stating carefully the exact nature of the thing he wished done. This involved the naming of machines, and the citation of various shafts, belts, wheels, bearings and what not that were to be fixed. I doubt if anything like this was ever done before by any man. Yet, when Edison was a young man, standing in line before a tax-collector's window, he was asked his name could not tell it, and was fired out of the line. But that, of course, was because he was thinking so hard about something else that he forgot both who he was and where he was.

You now have Edison's answer to the question, "What is memory?" It is the action of a particular form of intelligence, manifested by a certain group of the "little peoples." What is man? According to Edison, man, too, is nothing but intelligence.

"I consist," said he, "of 182 pounds, mostly of gross matter. Whatever intelligence I may have is furnished by my little peoples who weigh nothing."

Did Lincoln's Assassin Escape?

In This, the First Installment, Is Told the Story of the Armstrong Myth

By F. L. BLACK

IT WAS on the night of April 14, 1865, after committing his appalling crime, that John Wilkes Booth escaped from Washington with David Herold, an accomplice. Together they worked their way down through Southern Maryland into Virginia, where Booth was shot in a barn, about ninety miles south of Washington, eleven days after the assassination. Presently, however, rumors began to spread over the country that the man shot in the burning barn was not John Wilkes Booth, and that the officers in charge had wilfully deceived the government that they might procure the immense reward offered for the capture. It was said, and by many believed, that the real John Wilkes Booth had escaped to the Island of Ceylon, to Mexico, to Palestine. It began to be whispered that Andrew Johnson, Lincoln's successor in the Presidency, was the instigator of the horrible crime and that his motive was personal ambition.

Instead of dying out, these whispered rumors finally broke into print, and many newspaper and magazine articles, as well as several books, have been published from time to time in an attempt to prove them true.

During 1920-21-22, the mummified body of a man who committed suicide at Enid, Oklahoma, in 1903, was exhibited in many western and southwestern towns as the body of John Wilkes Booth. With it were pictures of the Booth family, copies of affidavits, and other supporting "evidence" to prove that the mummy was in reality that of the country's most abhorred assassin.

Scores of impossible stories of the escape, subsequent life and lonely death of Booth have been printed with a wealth of circumstance to support them, and thousands of persons may be found, especially in the South, who will never believe that Booth perished in the Garret barn.

One of the first of the published rumors that Booth escaped appeared in 1867 in the Louisville, Kentucky, *Journal*. This story claimed that John Wilkes Booth had been seen alive in the East Indies and that a Captain Tolbert had won the bet of a large sum of money by demonstrating this fact. A letter published in the *Journal* claimed that Captain Tolbert, who commanded a privateer in the South Pacific and Indian oceans, while in Bombay had learned that Booth was hidden on the Island of Ceylon. This story was apparently never fully investigated and whatever circumstantial evidence there may have been to sustain the statements in the letter was never disclosed.

The most definite and persistent of all the rumors that went the rounds was that which may be called the Armstrong Myth. According to this version John Wilkes Booth had lived for years at Atlanta, Georgia, "not as a recluse, not as a skulking wretch stealing out at night in the shadow of a nation's curse, but as a clergyman of the Episcopal church, and in the open light of day."

There lived at Atlanta, Georgia, the Rev. J. G. Armstrong, rector of a local Episcopal church. He bore a superficial resemblance to the actor, JohnWilkes Booth. By degrees the rumor grew, supported by his power of dramatic preaching, that the clergyman really was Lincoln's escaped assassin.

Dr. Armstrong knew of the facial resemblance, was rather vain of his dramatic powers, and did not discourage the belief to live that he was the actor-assassin. Dr. Armstrong's taste was for the stage rather than the ministry, he took a deep interest in amateur theatricals, and his favorite plays were Shakespearean. It is said that once when Edwin Booth visited Atlanta, Dr. Armstrong occupied a stage box in the Opera House, and that Edwin Booth was so startled by Dr. Armstrong's likeness to his brother that he sought out the clergyman after the performance.

The Memphis *Commercial Appeal*, in 1922, brought up the discussion as to Dr. Armstrong and received many letters from persons who believed the story. One letter stated:

"It is well known by many people still living in Richmond, Virginia, that John Wilkes Booth preached during the '80s for five years or more at Monumental Episcopal Church under the name of Dr. Armstrong and afterward had a church in Atlanta, Georgia, and died a natural death during the '90s."

Another reads:

"About twenty-five years ago, I read in a newspaper, The New York *World*, I think—an article from a man who some years previously had visited a western city, I cannot recall his name, but there was no effort at concealment, and he wrote with every indication of candor and veracity.

"One night he attended church. The minister's name he was informed, was 'Dr. Armstrong.' When the minister rose to begin the service our narrator was immediately impressed with the peculiar familiarity of his voice and manner, but could not recall any specific occasion on which he had seen 'Dr. Armstrong' before.

"In the course of the sermon, however, 'Dr. Armstrong' began to recite 'The Siege of Corinth.' As the recitation proceeded with great dramatic skill and power, the listener at once remembered that some years previously he had crossed the Atlantic on a ship that carried an unusually large number of distinguished and interesting passengers, among whom was John Wilkes Booth and some of his theatrical friends.

"On several occasions during the voyage, Booth entertained the ship's company with dramatic performances and once recited 'The Siege of Corinth,' with startling power and effect.

"So when 'Dr. Armstrong' launched into the recitation, the hearer immediately recognized the tone and manner of Booth and was filled with astonishment, but thought it best not to mention the matter.

"Some nights after this he found opportunity to call on 'Dr. Armstrong' at home. He was ushered into the sitting room with the explanation that 'Dr. Armstrong' was engaged with some one in the study and asked that he await his coming. Some subconscious curiosity prompted him to sit where he could see the door to the study. He waited long and patiently, for he was determined to see 'Dr. Armstrong.'

"Finally the door to the study opened and 'Dr. Armstrong' and Edwin Booth came out into the hall. Edwin took affectionate and brotherly leave of 'Dr. Armstrong,' and quietly passed out. 'Dr. Armstrong' then came into the sitting room. He had a slight limp as of one who had suffered a broken ankle, and the writer satisfied himself that he was not mistaken as to 'Dr. Armstrong's' identity, but made no mention of having received any information to this effect from 'Dr. Armstrong' himself."

A third says:—

"I would like to answer the question 'Was the Rev. Dr. Armstrong and John Wilkes Booth, one and the same person?' by saying that I believe I knew John Wilkes Booth in the person of the 'Rev. J. G. Armstrong,' of the Episcopal Church in Atlanta, Georgia, and I further believe that my readers will agree with the assertion when they shall have finished this article, which, I shall recount as nearly as possible, at this late date, for it occurred many, many years ago, when I was quite a young man. I was a resident of Atlanta at the time, and held a position on the Atlanta *Constitution* and knew the 'Rev. J. G. Armstrong' very well. He was a very brilliant man, highly educated, and it was said of him that he was the possessor of the finest private library in the city.

"As well as I remember, he was a tall, 'rawboned,' sallow complexioned man, with features as clear-cut as a cameo, with a limp on the left leg, I believe. His hair was long, falling almost to his shoulders and as black as a raven's wing. I used to wonder why he did not have it cut, but I learned later that he wore it in that manner to hide a disfiguring scar on the back of his neck. That was 'J. G. Armstrong,' or John Wilkes Booth, as I knew him.

"Now for the startling story!

"One day an old man, a stranger in the city, was standing in the main entrance of the Kimball House, on North Pryor street, when the Rev. J. G. Armstrong passed. He took one glance at the tall, limping figure, threw both hands above his head and exclaimed:

" 'John Wilkes Booth, as I live!'

"With this exclamation, he staggered and would have fallen, but for the assistance of two men, who helped him to a seat in the lobby. Soon recovering, he asked one of the men who the man was. 'That is Rev. J. G. Armstrong, of the Episcopal Church,' he was answered.

" 'That may be the name he goes by here, but his real name is John Wilkes Booth, the assassin of Abraham Lincoln,' he replied, and no amount of reassurance could shake his opinion.

"The story got into the papers, of course, and was played up in a more or less humorous vein and after the usual nine days' wonder was forgotten."

It is claimed that the Reverend Armstrong on several

(*Concluded on page 4*)

The body of John Wilkes Booth, assassin of Abraham Lincoln, was offered to THE DEARBORN INDEPENDENT for One Thousand Dollars.

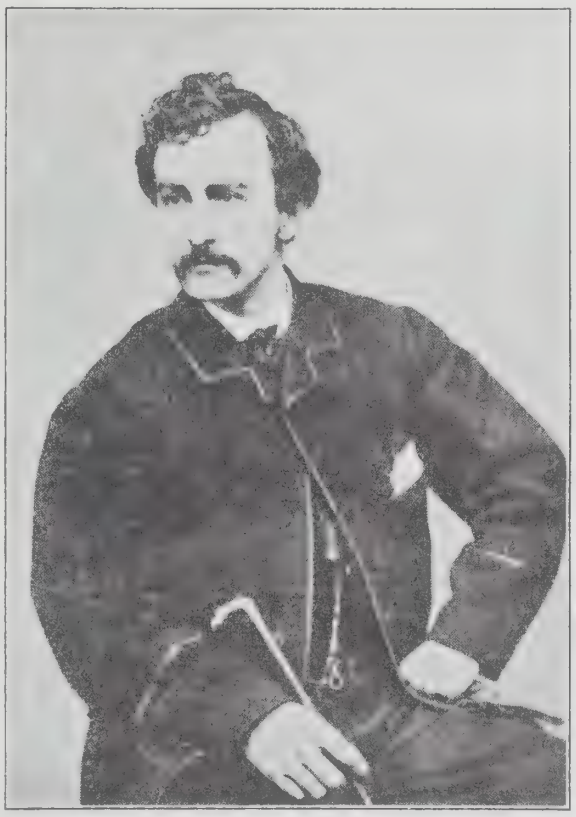
Affidavits and a wealth of circumstantial detail were to accompany it.

This was in 1920. The mummified body was owned by a citizen of Tennessee.

Since that time the rumor has broken out anew that the murderer of Lincoln escaped and lived undetected for 38 years after; that the nation was deceived by the report of his capture; that the large reward offered for Booth, dead or alive, was collected under false pretense.

THE DEARBORN INDEPENDENT, curious to know the basis for the rumor, conducted a thorough investigation into every phase of the matter and convinced itself of the spurious nature of the Booth myths, all and sundry. The accumulated material was laid away as of no timely interest until a recent fresh revival of the myth brought it to mind again. In *Harper's Magazine* for November, 1924, and in *Collier's* for December 27, 1924, articles on the question have appeared, while more recently American newspapers everywhere have carried *International News Service* stories purporting to be exclusive interviews with the surviving relatives of Booth—all of which provide amusing reading for anyone in possession of the facts.

It is proposed to give readers of THE DEARBORN INDEPENDENT a complete view of the evidence in the possession of this paper, that they may judge for themselves whether the fascinating stories of John Wilkes Booth's escape and survival are hoax or truth.



JOHN WILKES BOOTH, assassin of Abraham Lincoln.

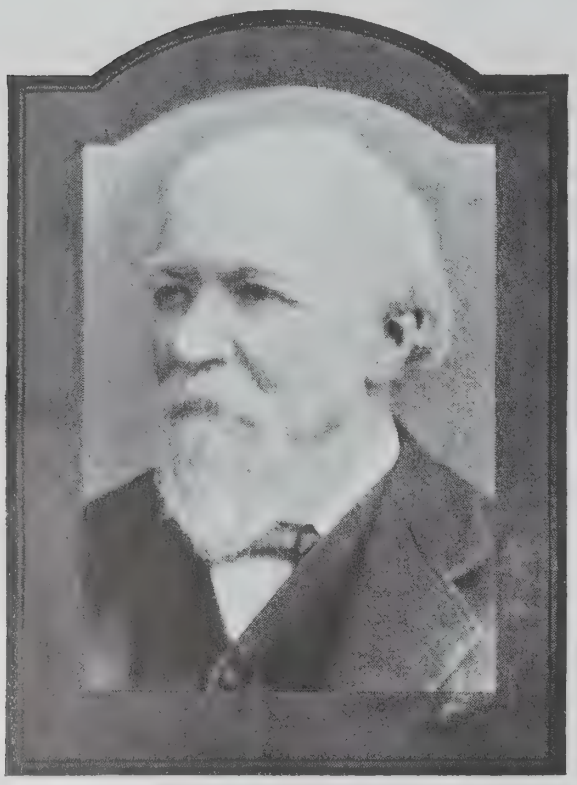
DR. J. G. ARMSTRONG.

DR. J. G. ARMSTRONG, who was taken for John Wilkes Booth.

A Memory of Robert Browning



Robert Browning,

"THERE is really no harm," said W. D. Howells, "in seeking the presence of a famous man. There are bores everywhere, but he is likelier to find them in the wonted figures of society than in those young people, or old people, who come to him in the love of what he has done."

This is finely, generously said, and it is my only excuse for having intruded myself, now many years ago, into the honored presence of Robert Browning. He was the supreme enthusiasm of my youth, and his influence abides with me to this day. Knowing this, a dear old friend, a lover of the young, gave me a kindly note of introduction with which I found myself one day before the house in Warwick Crescent, London, where the poet lived while in England. He was preparing at this time to leave it finally, and the clang of the knocker, or bell, reverberated through an empty hall.

The manservant after ushering me into a small study rather slowly and stiffly mounted the long flight of stairs leading to the floor above. Evidently Mr. Browning was in a room over the study, for I could hear a brief murmur of voices, the sound of someone rising from his chair with an energy that overturned it, steps hastening through the upper hall and springily descending the stairs. As these steps drew near, a feeling of positive fright assailed me; gladly would I have run away could I have done so unseen, but there was no escape and I sat helpless. Now the steps were at the door, an energetic hand threw it open, and before me stood Mr. Browning with a look of welcome and both hands hospitably outstretched. A cordial handclasp, a word of inquiry about the lady who had sent me there—

"How is she? Well, I hope." I merely nodded: speech was impossible.

"Active as ever, in spite of her years?" Again I nodded.

"And her sister, Miss ———, how is she?"

Through stiff lips I managed to articulate, "Well."

By this time we were seated, Mr. Browning in a chair opposite and close to mine; now all at once he became silent. I stared down at my folded hands, but felt that he was looking at me. Seconds passed, minutes; still silence. Finally, with an effort, I raised my eyes to his, and—lo! the spell was broken. Mr. Browning twinkled—there is no other word for it—and began to laugh.

"There now!" he said, "that is better. Now we can talk."

And talk he did, and question, though my replies were still monosyllabic. Pulling the letter of introduction from his pocket:

"I see," he said, tapping it, "that you like my poems."

"Yes," I murmured.

"Good! I like to be liked. And what do you like best of mine?"

Many of the shorter poems flashed to mind, but, of all things, I must name "Sordello"! He looked sincerely amused:

"Some of my friends think it obscure. Do *you* understand it?"

Rather vaguely I said, "I think so."

His amusement persisted:

"We are told that the proof of the pudding is in the eating—can you quote from it?"

By good fortune, the fine lines occurred to me:

> "That autumn eve was stilled;
> A last remains of sunset dimly burned
> O'er the far forests, like a torch-flame turned
> By the wind back upon its bearer's hand
> In one long flare of crimson; as a brand,
> The woods beneath lay black."

Luckily for me he did not seem to remember their initial position in the poem, and listened gravely: "That's not so bad," he observed.

And so the talk flowed on, he, as I now recognize, trying with wonderful gentleness to put at ease the badly scared girl before him.

He succeeded so well that presently I ventured to ask him a question long on my mind:

"Was there any picture of 'Flush'?"

"My wife's verses," he quickly replied, "there could be no better or more faithful likeness"; adding, "But I think I have somewhere a lock of Flush's hair." He sought through several drawers of the writing table before finding it, and gave me from its precious contents three hairs which I treasured for years.

From the lock of hair he looked up at a large portrait above the table: "My wife," he said gravely. "I hope you know her poems, too. They are far better than mine."

With thanks for the gift and for his kindness, I now rose to go, but—

"Wait!" he said, "Here is something you will like to see."

The something was a little volume with Mrs. Browning's delicate autograph on the flyleaf. I ventured to touch the yellowed page, and he smiled gently as I did so. Then he reverted once more to myself, asking various questions about my home, my college life, and my plans for the future. I remember confessing that I hoped I might write a little.

"There are too many who write 'a little,'" he said. "Be very sure that the call is clear."

Again I rose to leave, and again he exclaimed:

"But wait! I have forgotten one thing. Come back!"

He led the way down the hall to a disordered dining-room on whose wall were pinned several photographs.

"My son's work," he explained. "He is a sculptor, and I think this is the best thing he has done. I am very proud of it, and of him."

The photographs were three different views of Robert Barrett Browning's statue of Apollo, in the guise of a python wooing a nymph. The great serpent's coils embraced closely her lovely, drooping figure, and beautiful as is the group I was frankly horrified. I said as much.

"Well," admitted Mr. Browning, "the model felt quite as you do, I am told, at first; but the python never hurt her, and she ended by growing fond of it. It was a god, you know"—and he twinkled. "Not only that, but it grew fond of her." Again he twinkled: "She was a very nice girl, you see."

Once more I rose to go, and this time he shook hands and said goodby. But midway down the steps his voice again arrested me. Always I shall remember his very gentle, sweet expression as he said:

"My child, we are at the two extremes of life, and probably shall never meet again. Once more, goodby."

ELIZABETH BARRETT BROWNING.

With kind courtliness he bent, kissed me lightly on either cheek, and bowed in final dismissal.

From the street I looked back. He still stood there, an unforgettable figure, motionless, yet, even so, radiating vitality. Some years later, in Westminster Abbey, I paused by the slab marked "Robert Browning." It was heaped with flowers, mostly white, but among them glowed one bunch of deep red roses. Whoever placed it there had the right sense of fitness.

Those who love Robert Browning may be glad to add this little reminiscence to their store of memories. It is a reminiscence of gracious and exquisite kindness from a very great man to a very insignificant girl. She had no claim upon him save a passing introduction, but he honored the poor little draft with the full wealth of his goodness.

—E. L.

Did Lincoln's Assassin Escape?

Concluded from page 3

occasions confessed that he was John Wilkes Booth and there is no doubt but that he enjoyed the notoriety he received as a result of the resemblance. Dr. Armstrong died in 1891. The story given to the newspapers by his physician was that the cause of death was apoplexy. Stories were later published to the effect that it was due to an overdose of morphine.

The Armstrong Myth spread until it was finally and thoroughly investigated by the New York *Herald*, which carried the following story in the issue of April 26, 1903.

"When Dr. Armstrong died a record of his life was made public. According to it he was born at Ballymena, Ireland, on July 24, 1828, and was educated at Queen's College, Belfast, under the direction of his uncle, the famous James Glasgow, D. D., after whom he was named. He came to America in 1856, and prepared for the Presbyterian ministry in 1857 and 1858 at Xenia College, Ohio. His first charge was at Sidney, Ohio, where he married Miss Alma Hitchcock. She is still living in Atlanta, Georgia.

"From Sidney he moved to St. Louis in 1863, where he had trouble with the Presbyterian church and resigned to become an Episcopal minister. He attended St. Paul's Episcopal College and worked his way through as instructor in Hebrew and metaphysics in 1870, and was ordained as an Episcopal minister by Bishop C. F. Robertson at St. Paul's Church, Palmyra, Missouri, in 1871.

"From Palmyra he moved to Hannibal, Missouri, in 1871 to 1874; then to Wheeling, West Virginia, from 1874 to 1878; then to Richmond, Virginia, from 1878 to 1884; then to Atlanta, Georgia, from 1884 to 1888, where he again had trouble with his bishops. He gave up the ministry and lectured from 1888 until 1891, when he died suddenly.

"It is necessary to prove his career only prior to 1865, the year in which Lincoln was killed, to show that Dr. Armstrong was affecting a pose in permitting the rumors about him to be circulated. And a telegram to any one of the places mentioned in the above history would be sufficient. The following comes from the Rev. Dr. William G. Moorehead, president of Xenia College, where Dr. Armstrong, according to his record, prepared for the Presbyterian ministry in 1857, eight years before Lincoln died. Dr. Moorehead knew Dr. Armstrong in 1862, and speaks of his resemblance to Booth:

" 'I find in the records here,' he says, 'that James G. Armstrong was a native of Ireland, born at Ballymena in 1828; that he graduated from Queen's College, Belfast; studied theology in the Xenia Theological Seminary; was licensed to preach in 1859; settled at Sidney, Ohio, 1859; removed to St. Louis in 1863, and was afterward connected with the Protestant Episcopal church and settled at Wheeling, West Virginia. He was rector of one or more churches in the South, the last being at Atlanta, Georgia, I think, where he died some years ago. He married in Sidney, Ohio. He was somewhat lame, walked with a cane, but had a very handsome and attractive face. He so closely resembled John Wilkes Booth that he was actually mistaken for the actor, and one or more papers of the country some years ago confounded him with Booth. He was gifted as an orator, clear and keen of intellect, but erratic and opinionated, as I knew in 1862. Whatever became of his family I do not know.'

"All of which proves conclusively that the Rev. Dr. Armstrong lived in the western part of Ohio at the same time that J. Wilkes Booth was living at Baltimore and Washington. There is, therefore, only one supposition remaining, and that is that the Rev. Dr. James Glasgow Armstrong was the Rev. Dr. James Glasgow Armstrong and not J. Wilkes Booth, the assassin of President Abraham Lincoln."

The last and most elaborate Booth myth, the one which has caused the recent magazine and newspaper interest, owed its existence largely to the work of Finis L. Bates, a lawyer of Memphis, Tennessee, who wrote a book of 309 pages, first published in 1907, and owned the mummified body which was exhibited in southern and southwestern towns as that of John Wilkes Booth. More than seventy-five thousand copies of the book have been sold, and due to the astounding claims and accusations it contains, purchasers of the book are led to feel that they have made a discovery in concealed history. And as few of its readers have any opportunity to check the claims and "definite proof" so positively stated, the story succeeded in gaining numerous believers.

The title sheet is an elaborate affair, which sets forth the thesis the author hopes to sustain.

It was this claim that THE DEARBORN INDEPENDENT has investigated. It has in its possession and will publish all the available material bearing on the identity of the man who was shot in the Garret barn by Federal authorities as John Wilkes Booth. This, we believe, is sufficient to dispose of the question finally. The territory of the flight and capture was thoroughly covered, the identical sites examined, the living witnesses were interrogated, the contemporary evidence was again weighed, many forgotten records have been ransacked, and the mute gruesome relics of the crime have been made to yield their testimony.

It is now possible to enable the candid reader to determine the question with finality, and succeeding articles will, it is believed, fully serve this end.

How Job-Hunters Land Their Jobs

Presidents Have Been Unmercifully Harassed by Patronage Seekers; Need to Weed Out Undesirables and to Bar Unfit Applicants

By TOM EVERRITT

> "Government was instituted for the protection of individuals—not for their support. Office was to be given upon qualifications to fill it—not upon personal wants of the recipient."
> —*Thomas H. Benton*

THE invisible link that unites the Capitol, at one end of Washington, with the great governmental departments and the White House, at the other end of Washington, is political patronage. This link is unseen by the general public of the United States, but is clearly discernible to the naked eye of any close observer in Washington.

One end of the patronage link is securely bolted, at the Capitol, to the Senate and the House of Representatives. The other end, which extends to the governmental departments, is likewise securely fastened into the money requirements, called "appropriations," of those departments, to secure which it is necessary to apply to the Congress—meaning the Senate and the House of Representatives.

The demoralizing influence of this invisible power of political patronage has polluted the very vitals of our entire government structure to such an extent that it has produced, on the one hand, a set of bulldozing Senators and Representatives, who will refuse to vote for appropriations, necessary to carry on the government, unless jobs are furnished their political backers and constituents, and a set of recreant administrative officials, on the other hand, who furnished the jobs to secure their appropriations. There are exceptions, but not a sufficient number to warrant giving them here more than a line; although they deserve high credit for standing against the pie-hunters.

The Job-Hunters and the Presidents

The above was submitted to several government officials, to several experts on Civil Service and to several Senators and Representatives who are not patronage hunters, and each of them agreed that the greatest single need in the Capital of the United States today is the destruction of political patronage.

The political history of the United States shows that every President, not excepting George Washington, and including the present incumbent of the White House, has been unmercifully harassed by patronage seekers, job-hunters and patrons of the "pie-counter."

Probably no man has better defined conditions than Thomas H. Benton, of Missouri, who served thirty years in Congress. In his book, "Thirty Years' View," he has this to say, which is as true today as it was in his day:

"Government was instituted for the protection of individuals—not for their support. Office was to be given upon qualifications to fill it—not upon personal wants of the recipient."

Of course, since Benton's time, the U. S. Civil Service has become a government organization of great magnitude and of efficient operation. But the Civil Service does not cover the entire field of government employment activities. There is a sufficient number of "excepted" positions to keep the patronage pot boiling more vigorously than ever.

Some of the positions "excepted" from the Civil Service rules by the provisions of an Act of Congress, are about 16,500 jobs filled through nomination by the President of the United States and confirmed by the United States Senate. Of these, about 14,500 are postmasters at first, second and third class offices. The remaining 2,000 are the higher administrative officers of the government, including members of the Cabinet, assistant secretaries of departments and heads of bureaus at Washington, collectors of internal revenue, collectors of customs, registrars, receivers and surveyors-general of the Land Office; surveyors, special examiners, appraisers and naval officers in the customs service; superintendents of mints, assayers in mints, supervising inspectors in the Steamboat Inspection Service, commissioners of immigration and naturalization; U. S. marshals and deputy marshals, and others—something for every Congressman.

Approximately 250 Jobs Around the Capitol

But these are not all that are "excepted." Let us take a look at the others: there's the U. S. Shipping Board and Emergency Fleet Corporation, with their thousands of employes; there's the Library of Congress, with many; there are all the Federal courts; there is the District of Columbia government, not including police and fire departments; there is the city public library; there is the Federal Reserve Board, with thousands of others; there is the Federal Farm Loan Board; there is the War Finance Corporation; there is the U. S. Railroad Administration; there are the U. S. Prohibition Enforcement officers; there are the Deputy Collectors of Internal Revenue; there are the Commercial attaches in the Department of Commerce; there are Census Bureau Employes; there are Veterans' Bureau employes, and there are attorneys, special experts and special agents in practically all of the services which have been created during the past eight years.

In making an accurate statement upon the matter of "excepted" positions, it will never do to omit the Capitol patronage—that is, in the Capitol itself—which is a personal right attached to the members of the Congress. They have, by custom, made it personal.

There are thirty-four Senate committees—committees on this and on that—to which may be added the "*Patronage Committee*," making thirty-five in all. This Patronage Committee is a strictly private and confidential committee. It is a silent, gum-shoe concern. It is composed of Senator Irvine L. Lenroot, Republican, of Wisconsin, chairman; Senator Frederick Hale, Republican, of Maine, and Senator William B. McKinley, Republican, of Illinois. They meet privately and allocate, or distribute, the Senate's Capitol patronage to the other Republican Senators, in large or small amounts, according to the degree of their loyalty to the party leaders. Of course, a few Democratic Senators, who generally vote with the Republicans, get a few crumbs. The scramble after these jobs is terrific. If the Democrats were at present in possession of the government, the situation would be exactly reversed, and the Republicans would be holding the small end of the stick.

There are approximately 250 jobs around the Capitol, such as watchmen, policemen, doorkeepers, elevator men, and others, that are disposed of by the Senate Patronage Committee. In addition, there are about 450 other jobs, such as personal and committee clerks, assistant clerks and messengers, which are not under control of the Patronage Committee, but are under the personal control of individual Senators. In other words, there are about 700 jobs on the Senate side of the Capitol.

Bones That the Dogs Fight Over

On the House side, there are about 1,485 jobs, of which approximately 600 are under control of the House Patronage Committee. Yes, the House, also, has such a committee. It is composed of Representative W. W. Greist, Republican, of Pennsylvania, chairman, who has associated with him in this problem Representatives James C. McLaughlin, Republican, of Michigan, and Daniel R. Anthony, Jr., of Kansas.

Senators and Representatives may quarrel with each other about one thing or another; they may bitterly differ upon matters of legislation; they may have social differences, and little offense will be given or taken. But—when one of them transgresses upon the other's sacred and holy "patronage rights," friendship ends, the deadline is crossed, hostilities commence and the battle is on.

But let us get back to the White House. Every President, since the beginning of the government, as herein stated, has been worried, annoyed and plagued by hordes of office seekers, the majority of whom have, necessarily, been disappointed in their quests for jobs.

Nearly every President has indicated in messages or statements that he favored some plan to relieve the pressure of patronage. Some have actually partially relieved the situation by covering into the U. S. Civil Service certain positions. Unfortunately, however, it seems that this has always been followed by the creating of new jobs of other kinds.

President Coolidge has urged the classification under the Civil Service law of first, second and third class postmasters. There are 944 of the first class, 3,999 of the second class and 10,745 of the third class—all presidential appointments. There are 36,478 fourth-class postmasters and 44,984 rural mail carriers who are within the Civil Service.

These fourth-class postmaster and rural carrier appointments are the bones that the "dogs of the spoils system" fight over. The average Representative will spend more time jockeying about one of these appointments with the politicians back home in Squashtown than he will give to the most important piece of national legislation. They are the cause of more trouble to the Civil Service Commission than all the other classified positions put together, because the average Congressman wants to appoint his man regardless of the outcome of a Civil Service examination—even if his man fails in the examination.

Regardless of the fact that the Civil Service law provides "That no recommendation of any person who shall apply for office or place under the provisions of this act which may be given by any Senator or Member of the House of Representatives, except as to the character or residence of the applicant, shall be received or considered by any person concerned in making any examination or appointment under this act," these Senators or Representatives, by some device or other, usually succeed in having their personal selection appointed to these fourth-class postmasterships.

Let us proceed to the Prohibition Enforcement unit. The Anti-saloon League has a majority in both branches of the Congress. It has always been able to obtain there anything it went after. To secure the one-half of one per cent alcoholic content provision written into the law, the Anti-saloon League gracefully yielded to Congress the right to except the Prohibition Enforcement field force from the operations of the Civil Service law, thereby creating more patronage for Senators; for, be it known, members of the House of Representatives have little or no say in the appointment of the members of that force. At present, there are 1,050 enforcement officers in the United States, including fifty-one state directors, the head of the field force, group heads, inspectors, and special raiders. There are, in addition, 715 men who comprise what is known as the "mobile force," who have "runs" that cover the entire country and who report to only one chief.

"Enforcement" Officers and Prohibition

With all due respect to the reputable members of this force of 1,765 "enforcement" officers, it is known that the entire organization is permeated by characterless men—political ward heelers from the tenderloin districts of our big cities, ex-bartenders, ex-saloon keepers, some former criminals and a motley crew of incompetent and not over-honest political nondescripts. In the appointment of this assortment of political patronage pilferers, the members of the United States Senate show their utter disregard for the honorable enforcement of the Eighteenth Amendment.

As said before, these men are exempt from the operations of the Civil Service act. Many Prohibition Enforcement officers have been indicted by grand juries and dismissed. The distrust by the public of this branch of the government service is so great that a movement is on foot to place the entire Prohibition Enforcement field unit under the Civil Service act with the understanding that the present force will not be covered into Civil Service without examination. The Anti-saloon League is now heartily in favor of this. The proponents of the proposition point to the high character of the 357 members of the narcotic unit, who are under Civil Service, and who obtained their places through competitive examinations. It is believed (in which the Anti-saloon League concurs) that competitive examinations embracing mental qualifications, character and high-grade experience will weed out present undesirables and future unfit applicants; thus, by a process of elimination, giving to the Prohibition Enforcement unit a force of men that will eventually cause respect for the law. The application of the merit system to this department of the government will, at least, do much to head off inefficient and characterless men.

In his Message to Congress in December, 1923, President Coolidge said: "The Civil Service Commission has recommended that postmasters of the first, second and third class offices be classified. Such action, accompanied by a repeal of the four-year term of office, would undoubtedly be an improvement. I also recommend that the field force of the prohibition enforcement be brought within the classified civil service without covering in the present membership. The best method for selecting public servants is the merit system."

Best System the Merit System

It appears to be up to the Congress of the United States to step in and relieve this intolerable situation by passing the necessary laws. It is obvious that the President will sign them.

It is only fair to state here that there are many Representatives and several Senators who wouldn't "walk across the street" to ask for or demand a job for a constituent or for a political ally "back home." These men attend to the business of legislating; which is the purpose of their presence in Washington.

It is safe to say that the miserable condition of the public service outlined herein will not, within another generation or two, be cured by Congress, unless the people of the country demand it.

Chinese Bandits Wreck and Loot a City

Some Heads Were Cut Off, But They Were Not the Right Heads

By VOL REMARC

Nanking, January 10—

THREE nights after I arrived in Nanking the wealthy business section of the city, known as South City, was looted and partly burned, the loss mounting into millions of dollars and several lives. It is said that comparatively few of General Chi Hsieh-yuan's soldiers were guilty of the looting.

I had expected to spend the winter months in Pekin, but instead I am spending them in Nanking, a city not lacking in an eventful, picturesque and interesting past, and by no means devoid of thrills since I have been here.

When the Kiangsu-Chekiang provinces started a war early last September I made my plans to spend the winter in Pekin, engaging passage on a ship sailing out of the port of Shanghai, October 1. I had been told that October was an ideal month in which to see Pekin for the first time. However, before the first of October the war had widened its scope and had taken in the vicinity of Pekin. In fact, it promised at that time to center about that city, and, in addition, a decidedly anti-foreign feeling had shown itself there and foreigners not then within the city were urged to postpone their visit until the trouble was over. As I had planned to spend the next winter in Nanking I simply shifted the years about in my plans, for in China one goes to see a place when one can, never knowing what the next day may bring forth.

So it was to Nanking I came, to find that Nanking was not without its stories of coming troubles. Nor for that matter is any part of China without some disquieting rumors at the present time. However, it seemed reasonably quiet, and besides there were two American gunboats anchored in the Yangstze River off Nanking, each with a sizeable landing force of well-trained men. They seemed to spell safety, if not peace, especially as the commanding officer on one of these vessels was a friend of mine, and his wife and two other friends were already in Nanking, and had offered to find a boarding house for me in their compound.

So in Nanking I arrived on a bright, warm, sunshiny December day, and in Nanking three nights later I saw part of the city looted and burned while I was safe in bed a mile distant.

I had often wondered just what I would do if I were caught in a city that was being looted. I had framed my plans and rehearsed my part to the last line. But I didn't get the opportunity to appear on the stage at all. I just simply sat up in bed, watched the flames mounting higher and higher, and breathed a little prayer of thankfulness when I saw them spreading in the other direction and knew that, for the moment at least, I was safe.

I felt very calm, and very sorry for the poor Chinese who were being looted and burned, or killed in cold blood, all for a bit of plunder. The flames were so fierce that the countryside was almost as light as day, and I could see stealthy figures, bent under heavy loads, as they scurried over the fields away from the conflagration. I wondered what outrages they had committed to secure their ill-got gains; I wondered if they were robbers or merely people slinking off into the night, hoping to save some of their own wares out of the horror they were leaving behind. The looting and the fires seemed to be confined to South City, and if it could only be kept within those bounds, we, living in the vicinity of Nanking University campus, were safe.

It had been an exciting night and I was very tired. Just as the first sign of dawn appeared I lay back on my pillow and must have slept at once. It was broad daylight when I was awakened by the coolie pounding on my door and calling upon all his ancestors to help him impart to me the information that my bath was long ago drawn and now almost cold, after he had gone to all the trouble of getting it the right temperature to suit a very fussy "missie."

The street after the looters were through with it. This street is named San San Ka and was once one of the busiest streets in Nanking.

All that was left of a silversmith's shop which stood beside the Zen Ang temple.

The new administration at Pekin had deprived General Chi of his position as tuchan of Kiangsu, and ordered his departure from Nanking. The new administration that came into being after General Feng's *coup d'etat* in the middle of October is anti-Chihli, while General Chi is an old Chihli war horse. Under plea of possible looting if he left, Chi stayed as long as he dared, and then left very quietly at three o'clock on a Sunday morning. The looting started at midnight on Monday. It was not unexpected by the citizens, either native or foreign. As rumor tells it, Chi's soldiers had not been paid for three months, and an unpaid soldier usually goes out and collects, which means that he goes out and loots as soon as the opportunity offers. But Chi's men were loyal to him, and showed him the respect of waiting till after he had left Nanking before they started looting, thus allowing him to save what "face" he had left, after Pekin's action.

Some say that Chi left Nanking a bankrupt; others are equally positive that he had been able to "squeeze" several millions of dollars out of the war. The general belief is that he left broken in spirit and purse, for his arch enemy General Lu Yung-hsiang, over whom he had won a "victorless victory," not three months before, was being sent by Pekin into Nanking as pacifist commissioner, or peace governor, or call it what you will, it makes no difference; the thing that really counts is that he was being sent here to succeed General Chi, and that Lu from henceforth was to be the big gun in Kiangsu, Anhui, and Kiangsi provinces, while Chi was being forced out in the night to take refuge wherever he could find it. Rumor has it that Pekin had gone so far as diplomatically to suggest that he travel for a number of years in America and in Europe. Chi for the moment is a down-and-outer. That is the manner in which China sometimes rewards her bravest warriors.

In a few hours after Chi had left Nanking, the merchants heard of it and began to make preparations against loss of their goods. A leaderless army soon gets out of hand, and General Lu had not yet arrived in Nanking, and not knowing when he would, many of the shops and several of the banks closed their doors and nailed up their windows. The largest curio shops buried the best of their treasures. The silk shops sent bales of their best silks into Shanghai, and the silk factories stopped their looms and hid their raw materials. The same is true of the tapestry shops and the looms in the factories that turn out the most marvelous tapestries in the world.

But at that there were enough desirable silks left in the South City silk shops alone to net a haul of more than a half-million dollars. The silver shops suffered a like loss, and the tapestry industries a like sum. In addition, the crazed soldiers smashed looms, and burned blocks of stores and houses.

A familiar sight on Nanking streets, a priest.

Several men and women who sought to protect their property were shot dead, and others were trampled to death by looters and the fleeing populace.

But the looting was all confined to South City. It is said that a certain high official in the city had ordered his troops not to interfere in South City, but to see that the looting was confined to that section. According to the Chinese and to the missionaries of the city no effort was made on the part of this official to stop the looting or to prevent its being started. There are estimated to have been only about 150 of Chi's soldiers actively engaged in the looting. No arrests were made that night, nor were any made the next day. By the end of the first day when no arrests had been made, the populace became so incensed that this high official's ears were reached, and he decided it was about time something was done.

The next day it was announced that a hundred of the looters had been arrested, and that they would be executed, ten a day till the last man had paid the penalty. The executions began that very day.

That satisfied the people until the following day when inquisitive ones visited the execution grounds and found that civilian prisoners in the public jails had been dressed up in soldiers' uniforms, and led to the execution grounds, and decapitated. The discovery was made when, on the official's orders, the heads and their detached bodies were left lying on the ground, that the curious might view them. Then it was discovered, so it is claimed, that the men who had been beheaded were not soldiers, despite the fact that they were dressed in soldier uniforms.

As far as I can learn the executions took place as scheduled, for but two days. What became of the other eighty who were supposed to have been captured no one seems to know.

Nanking is a wonderful old city; how old is a disputed matter. Mythology and history are so interwoven that the exact date of its founding will always be doubtful. The earliest legend of the founding of the city tells of a northern king who had three sons, T'ai-peh, Tchong-young and Ki-li. Seeing that the youngest, Ki-li, was the father's favorite the oldest sons went into voluntary exile to free him from the embarrassment of their presence in choosing an heir. They went to live among the barbarians of the south, and there, having disfigured themselves to hide all traces of their royal birth (which included cutting their hair), they founded the city of Nanking. That was in the year 1260 B. C.

Historically, however, no such great age is attributed to the city, though no one claims it is of recent growth. The finest of the Confucian temples in the city is situated on the site of a former arms factory. That factory existed during the reign of the King of Wu (495-473 B. C.) and the village that grew up around it was pointed out in the Han dynasty, about the time of Christ, as one of the antiquities of the Wu kingdom. For this bit of history I am indebted to a paper read by Mrs. Margaret Thomson before the Women's Club here, who says that in 372 B. C. another settlement was made just outside the present South Gate. Then again in 222 B. C. came the Emperor Tsin Che, the greatest monarch of that era, who was a sort of Oriental Louis the Eleventh. In that year he had great trenches dug along the sides of Purple Mountain, and through the surrounding hills, in an effort to release the "imperial air" which should bring good fortune to his family and the surrounding region. It is thought that the canalization of the river, Ta'in Hwai Ho, that bounds the city on the south and west, and branching divides it at Fu'tz Miao, had its origin in these excavations.

According to this same paper, the settlements continued to increase and before the time of Christ there was a new city, T'ai-tcheng (the city of the platform) that although once destroyed in A. D. 280 was rebuilt and formed the dwelling place of kings and rulers for many centuries. The city had been known by seventeen different names, in as many periods of the world's history.

(*Concluded on page 15*)

A beggar who rolls over and over in the mud.

Mr. Ford's Page

THE Cave of Adullam, we are told, was a general refuge for "every one that was in distress, every one that was in debt, and every one that was discontented." Distress may be relieved, debts may be paid, but discontent is like a disease that is hard to eradicate. There are two classes of discontented persons: those who are not satisfied with being what they are, but can give no valid reason for such dissatisfaction, and those who wish to be what they are not and bring forward specious arguments in support of this aspiration.

On the one side the discontent may be called negative; on the other it is distinctly positive. Probably the original inhabitants of the Cave of Adullam were of the former class, for their grievances do not seem to have taken any definite shape.

In almost every society and organization there is always a number of Adullamites of the negative class. They will do nothing, will promise nothing, and agree to nothing; and as a rule if they will trust to nothing it usually follows that nothing will be trusted to them.

When discontent of this kind takes hold of a man it has a disastrous effect on his efficiency, both mental and physical, and prevents advancement. His imaginings are like a thick fog that looms up and impedes the passage of a ship. Vision is clouded and progress retarded.

Discontent is like a poisonous fungus which throws out millions of spores and destroys all with which it comes in contact. Discontent frequently leads to disaster, and the victim blames everything and everybody except the real cause—himself. When trouble comes he retires into himself and multiplies imaginary wrongs. It is then that he seeks an atmosphere in harmony with his mood until he conceives the world has acquired a better appreciation of his value.

But the Adullamite finds it more difficult to find a suitable location for the nursing of his grievances than he anticipated. The cave, so to speak, seems to be overcrowded. The friends to whom he relates his story turn a strangely unsympathetic ear. Others listen only to scoff when his back is turned. After a time the victim of this distemper begins to think that all men are against him, and he develops into a sort of an Ishmaelite, wandering about from place to place.

There are thousands who would otherwise be good citizens who reach the nomad class through the avenue of discontent. The man with a chronic grievance is one of the most miserable creatures on earth. He hugs his delusion like a precious treasure, worships it like a fetish, and gloats over it like a miser. He finally arrives at a stage where if anyone in good faith offers or suggests a mode of alleviation, he regards the advice with profound suspicion, and even resentment. He prefers to capitalize his grievance and grow more miserable on the proceeds.

At length he reaches that frame of mind which makes him the avowed enemy of everything constructive.

He has come to the conclusion that the world owes him a living, and that it should be administered to him with a silver spoon. But there is already too much spoon-feeding in the world. Its tendency is to do away with that sturdy independence which formerly characterized certain races, and which has been at the bottom of all real progress. The desire to get things easy is growing stronger in a large proportion of the human race today, and there are governments and administrations who pander to this weakness in their eagerness to achieve power and to retain it.

Honest endeavor, no matter in which way directed, is never lost. It is like a precious grain of radium and is bound to get somewhere, but the man with the chronic grievance seldom gets anywhere. There are some who deliberately go and bury their talent like the man in the Bible. They go still further than their scriptural prototype by continually digging it up again and reburying it without making use of it.

There is a story in Esop about a man who dug a hole in the ground and placed therein all the gold he possessed. Every day he went and visited his treasure, gloating over it and passing it through his hands. One day some of his neighbors unearthed the hoard and carried it off. When the miser came as usual and found his treasure gone, loud were his lamentations.

"Did you ever make use of your gold?" he was asked by one of his friends.

"No," he said, "but I loved to go to the place where it was hidden owing to the pleasure it gave me."

"Then," was the reply, "if the gold was of no use to you, there is no doubt you will derive just as much pleasure from visiting the hole wherein it was concealed."

Brooding over fancied wrongs and hatching of imaginary grievances are plagues that afflict the world today. It is a sort of mental hypochondria which is practically incurable. The ordinary hypochondriac derives a singular satisfaction from reading the pages of patent medicine almanacs and selecting the particular disease which fits his fancy and affords him the best opportunity of taking his favorite medicine, but the poor victim of discontent can turn to none of these things. He can only wait for some congenial companion with whom to discuss pet symptoms for which there seems to be no remedy and for which none is wanted.

Mankind may be divided into two classes: those who blame themselves for their misfortunes, and those who blame somebody else. This blaming of somebody or something for all the ills that happen from earliest childhood is not an uncommon symptom. It starts when the child lets a dish drop on the floor and smashes it. "It fell out of my hand," he will say. He does not admit that he carelessly let it drop. Perhaps a little later in life he will stumble over a chair and will straightway accuse someone of having left the piece of furniture in his way. In reality it was because he did not look where he was going that the accident occurred.

At school a boy of this type invariably fails to win the prize. Laziness and neglect of his studies have caused him to miss the honor; but he asserts that the prizewinner's success is due to favoritism on the part of the teacher, and that he, the loser, has been deprived of his rights. His story is unfortunately believed by a fond father and mother who confirm the child in the opinion that he has been the victim of a grave injustice.

One of the most deadly mistakes that parents can make is to encourage their children in matters such as these. It causes a child to grow up irresponsible, unreliable, and untruthful. At college one of this type is usually a failure, in the office or factory an inveterate grumbler. Faults are never admitted, blame is always denied. It is not uncommon to hear such an individual declare that he "never made a mistake in his life." People who are firm in this belief are found everywhere, harboring ill-will against all who venture to doubt their assertion.

In place of retiring into the obscurity and the mist of misdirected energy to brood over fancied misfortunes, it is better to go forward in the broad daylight of conscientious effort. In the journey of life it is those who are not afraid of the heat and the glare of the noonday sun and the brightness of the skies, who can fix their unwavering gaze on the gleaming tops of the everlasting hills, and who seek the purest atmosphere and the clearest prospect who are the most successful.

Happiness is a jewel that is picked up on the highway of effort, not on the bypath of indolence.

ONE of the greatest obstacles to a man's advancement is discontent, not the healthy discontent which is at the back of all legitimate ambition, but the discontent which, negative in its tendency and destructive in its quality, sucks the sap from the tree of prosperity and leaves nothing but dead branches behind. Nothing is gained by sitting down and blaming the world for all the ills by which one is overtaken. It is far better by self-analysis to ascertain just how far the world is to blame, and then by deduction to square one's own side of the balance. A happy and contented individual is an asset not only to his employer but to the whole community. A happy and contented nation is an example to the whole world. Where there is contentment there must be peace.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Justice Before Charity

THE DEARBORN INDEPENDENT is in receipt of a letter from George W. Armstrong, of Fort Worth, Texas, setting forth a plan to urge President Coolidge to negotiate an international conference for a settlement of the French war debt on a basis of the purchasing power of the dollar when the money was advanced, which he claims was considerably lower than at this time. Mr. Armstrong gained considerable note three years ago by the publication of vigorous attacks on the Federal Reserve System. He incloses copies of a letter written to him by M. Clementel, French minister of finance, and another he has sent to President Coolidge.

Nobody could object to the proposition that it is unfair to compel the payment of a debt contracted when dollars had only half their present purchasing power in dollars of today; but France is not alone in this. Every national debt has been contracted on the same basis.

More than half our own debt is represented in guaranty bonds which the United States must pay, and must be paid in dollars of the redemption date, although borrowed in dollars worth less money. Any difference conceded to France must be made up by the taxpayers of America, who bought the war bonds, for it was the man in moderate circumstances who raised the war funds. Shylock waited until deflation to secure the same bonds at a discount, and now the man compelled to suffer the squeeze is being asked to share the new addition to the burden with the French people, including the money kings represented by M. Clementel.

"Cui bono?"

Is it not plain. Hidden back of the proposition to compound the French debt to this nation lie millions of French securities held by the Shylock class, and any concessions the United States makes will increase the chances that these securities will be paid in full, though acquired at a discount. Further, the more of her debt she can satisfy, the more she can borrow, on terms more usurious than ever.

If the people of the warring nations, Entente and Allies, could get together in a representative conference of statesmen, as devoted to their countries as the tools of Shylock are to their master, every war debt could be paid in a year, and without usury.

Meanwhile, Justice comes before Charity and any concession now is unjust to the American taxpayer, whose plight is as hard as is his French comrade's.

M. Clementel closes his letter to Mr. Armstrong with a sentiment which makes one wonder.

> "It is my understanding through certain friends in America that your personal relations with the President are friendly. I congratulate myself that you were willing to constitute yourself one of the advocates of the cause of the Allies with him and especially of the cause of France."

That quotation alone, when read by President Coolidge, in the copy sent with Mr. Armstrong's appeal, is apt to have an effect not intended.

A Classical Renaissance

GREEK is not reviving but Latin, it would appear, is again commanding attention. In the state of Indiana 8,000 pupils, representing 294 high schools, recently participated in a Latin contest. Texas, Arizona and other states are turning their attention to Latin. Of the forty-eight state superintendents of public instructions, thirty-nine are in favor of Latin, seven are non-committal and two are openly opposed to its teaching. The total enrollment in Latin in the secondary schools of the country last year was estimated at 940,000 and an additional 40,000 took Latin in the colleges.

The American Classical league last fall made a voluminous report embodying the results of an investigation made in the past three years in the matter of Latin teaching. The league holds that the relationship between proficiency in Latin and comprehension of the principles of English grammar and syntax can be traced with certainty, and that pupils excelling in the dead language were found for the most part among the best trained in other respects.

This shows that a "dead" language is no more dead than the corner stone of a modern structure which rises majestically above the earth.

What Does It Mean?

IS THE Dominion of Canada arriving at that state of national mentality which led up to the "Boston tea party" and Bunker Hill? Canada feels sore, and naturally so, because she has been severely snubbed by the mother country. The lion has given her cub a nasty scratch. What is it all about? Simply a decision by His Majesty the King's Privy Council that the Canadian Industrial Disputes Investigation Act is unconstitutional.

Pending an appeal for a reargument of the case, Canadian public opinion is seriously disturbed and has a tendency to review the whole subject of relations with the mother country.

According to an authoritative statement the present situation was brought about by an appeal to the Courts last year by the Ontario Hydro-Electric Commission, whose employes had applied for a Conciliation Board under the Disputes Act, which provides for the compulsory setting up of such a board at the instance of either party. The Dominion Government insisted on putting the Act into force, and was upheld by the Canadian Courts. The Privy Council, on appeal, has not only freed the Ontario Hydro-Electric Commission from interference by any Conciliation Board, but has scrapped Canada's seventeen-year-old legislation.

The fat is not yet in the fire, but it is showing signs of beginning to drip. As one Canadian expresses it, "Had bombs been dropped in every industrial center in Canada by the dignified members of the Judicial Committee of the Imperial Privy Council they would have caused scarcely more sensation than was raised by their Lordships' decision."

This Industrial Disputes Act has been the ewe lamb of Canadian legislation, and the cutting of its throat has come as a shock. Under it no fewer than 441 Boards of Conciliation to settle labor disputes have been appointed, and in all but 37 of these cases strikes were avoided. And now this medium of peaceful settlement has been declared *ultra vires*.

Is it an augury of future events that while Canada has thus had one of her pet laws scrapped by the supreme judicial body of the British Empire, an important treaty between the United States and Canada has just been ratified by the House of Commons at Ottawa. The treaty deals with rum-running, the drug traffic, and the recovery of stolen goods, and has already been ratified by the United States Senate. An agreement of this beneficent nature is bound to draw the two countries closer together.

Canada thinks she can legislate for herself; Great Britain does not think so. The United States thinks that Prohibition is a good thing, but Britain views the matter differently. Between two countries there is co-operation, between two there is disagreement. What this means in relation to the future of the countries concerned will be another chapter in history.

Playing the Game

GOLF should be regarded as a medium for the attainment of health and happiness in pleasant companionship, says John D. Rockefeller. With this mental attitude many will agree. It goes without saying that all outdoor games should have health, and consequently happiness for their object, otherwise they would be a sheer waste of time. Any so-called recreation that does not improve either the mind or the body ought to be promptly scrapped.

Perhaps there is nothing that more quickly destroys all pleasure in a game, no matter of what kind, than an irascible or easily offended partner. This usually makes a pain of what is meant as a pleasure, and robs the pastime of all its beneficial qualities.

There is another kind of sportsmen who never know how or when to quit. They take their recreation in large doses, and for one unaccustomed to this sort of thing, there is more pain than pleasure. While a healthy spirit of emulation is good, the desire to "show off" which characterizes so many golf players, as it does devotees of other games, is a thing to be shunned.

The Next on the List

AND now it is Zinovieff, the man on account of whose activities in the Red Internationale Secretary Hughes said the Soviet government should not be recognized by the United States. Danton, Robespierre—the "sea-green incorruptible"; Trotsky, the commander of the Red army and popular hero, all had their day, and then the weather changed and they went down before the storm.

Most of the world's revolutionaries have been shiftless ne'er-do-wells who blamed the world for their failures, and sought their revenge by trying to destroy all that the world held sacred. This is what the Jew Zinovieff has been trying to do. But he has gone about it the wrong way. He has been trying to assume the mantle of the Hebrew prophet who brought the tables of the law from the top of Mount Sinai. He is, however, but a shoddy sort of a Moses, and the nations through which he has broadcast his decrees have refused to take them seriously or to drink from the muddy stream of Bolshevism.

The undermining and destruction of the Anglo-Saxon race through the disintegration of the United States and the British Empire is the modest program nourished by this unwholesome demagogue. He has failed in his schemes. More than this, so far as his projected international holocaust is concerned, he has stirred up a resentment against all things Red that has reacted to the consolidation of the forces of constitutionalism. And now his friends of the Internationale, and the Soviet, which is run by the Internationale, have come to the conclusion that he is merely a stupid and overfed blunderer, and he is likely to follow Trotsky to the Crimea or some other place where oblivion awaits.

A world's court before which such men could be impeached and brought to trial would be the finest kind of internationalism that could be thought of. The disturbers of the world's peace are not nations, but individuals who for a time dominate nations. Have these men removed to some carefully selected region where they can only preach to penguins or polar bears, and the human race would be able to pursue its legitimate course.

About Cover Designs

THE people who appear on our magazine covers are undoubtedly retained for sound commercial reasons. They are mostly carefully complexioned persons with regular features, painted in tones that pleasantly blend against harmonious backgrounds.

And yet, try facing an entire news-and-magazine stand decked with scores of monthlies on whose covers these attractive figures are disposed. You are reminded of face creams, breakfast foods, Wearever Hosiery, Stylmore Klothes, Kloskutt Kollars—for the advertising pages are thick with figures of just this sort—and that's about all.

In this unending procession of colorful trimness there is a trace of perfection gone to seed.

Here and there we recognize a type which at its inception held truth and life—a girl with hair falling in careless ringlets whose laugh you can imagine; a young, ruddy, slightly sullen fellow, whose neck, despite the forward thrust of the head, swells manfully at the nape. But they are *only types*, now. They have postured in every fashion against every imaginable background; the gayety or sullen manfulness that attracted us has become conventionally frozen upon their features, and what was living in them has slipped out and away.

Some new impulse is needed—some impulse in its working at once violent and precise—which will break through the glazed face of contemporary magazine-cover art, and let the life it tries to embellish, but hides, come pouring through.

Most of the so-called rebels are engaged in a mystic shuffling of geometric forms. The bulk of the remainder continue to be freakish without being interesting. Of all the artists at large today, those who devise covers for our periodicals are nearest the stream of contemporary life. They are confident and competent. Perhaps, as in all groups, most of them would prefer to drift along the line of least resistance. But we feel sure that at least a few of them are entirely too proud to shirk a task which needs so obviously to be performed.

It is evidence for our contention that German artists of the most commercial sort—that is, the designers of advertising posters—are making wonderful progress in interpreting truthfully and arrestingly the spirit of this age. These stout fellows have not allowed themselves to be driven to pattern-making or embroidering by the uproar, the struggle, the huge uncompromising structures of our industrial world. One sees in their work that the steel-hard Time-Spirit has surrendered to them its truth.

Smuggling the Alien Through Mexico

Rio Grande Takes Place of Jordan in Crossing to Promised Land

By MAX BENTLEY

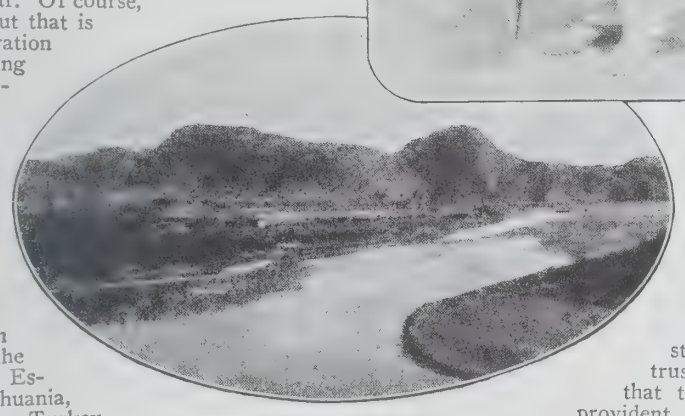
MORE aliens are being smuggled into the United States than are regularly admitted by law. Here is a new form of bootlegging that has become an industry rivaling rum running; safer and more profitable, too, because the smuggled goods can run and hide, and pays well—anywhere from $50 to $2,000—to be surreptitiously delivered across our borders. Smuggler rings reaching entirely across the world have been operating since we imposed our first literacy test on immigrants. Lately, with the passage of the new Immigration Act of July 1, 1924, the industry has branched out enormously.

The rum runners make their major drive on the Atlantic seaboard, but the alien smugglers are mainly choosing the land route through Mexico. That has made the Rio Grande, the boundary between Mexico and Texas, strategically the most important stretch of our six or seven thousand miles of international border. From end to end—El Paso to Brownsville—it fairly bristles with mounted immigration inspectors trying to spread themselves thin enough to cover 1,400 miles of water front.

It is not a very great distance from El Paso to Brownsville: on a straight line only about 700 miles; but the border does not follow a straight line. It follows the Rio Grande, and the Rio Grande is the crookedest large stream on the continent. And easily fordable, too, over most of its course, with its low banks and shallow water stage nine months of the year. For 800 miles it traverses lonely regions having but fringes of population; and this condition is very hard on the immigration men. There is no telling how many foreigners succeed in slipping through at these remote places. But at the bridgeheads—El Paso, Del Rio, Eagle Pass, Laredo, Rio Grande City and Brownsville—they are being turned back by the thousands. THE DEARBORN INDEPENDENT lately sent me down the Rio Grande, and I spent much time with our hard-worked immigration riders. Without an exception they told me that smuggling operations across Mexico are attaining simply enormous proportions.

The new law limits the entry of aliens for citizenship to 2 per cent annually of the nationals of any country resident in the United States in 1890. While it remains in effect the quota allotment for all nations will be only 164,667 a year. Of course, the significant thing about that is that the bulk of immigration to our shores will swing back to the so-called Nordic strains of Western Europe—the British, Dutch, Germans, Irish Freemen, Scandinavians, and Swiss—and away from the South European-Slavic tide that has been engulfing us for twenty years. In that period the bulk of immigration has come from Armenia, Bulgaria, the new Czecho-Slovakia, Esthonia, Greece, Italy, Lithuania, Poland, Rumania, Russia, Turkey, and Jugo-Slavia. The new act limits the quota for these nations to 17,314, combined—hardly more than one-half the allowance to the Irish Free State alone (28,567), and only 10½ per cent of the quota allowed to all nations.

The most important bridge in America, from the point of view of immigration. The international bridge at Laredo, Texas, over the Rio Grande.



Above—Our new *visé* regulation imposed on Mexican laborers crossing to work on Texas farms is a heavy handicap. They can't pay it. Oval—Why the Rio Grande is easy to cross. Mexico on the left bank.

Such a drastic cut in immigration at once explains the rise of alien smuggling; and the allotment of the quota explains why practically every foreigner apprehended along the Rio Grande is a South European or Russian Slav.

Lack of understanding and good-fellowship between the United States and Mexico is an even more pertinent reason why the smuggler ring makes its major onslaught at the Rio Grande. Thus far Mexico has done nothing to hinder the passage of aliens across its territory. An immigration official told me that a shipload a month are dropped on the wharves of Vera Cruz and Tampico by certain "outlaw" steamship companies that have refused to allow our Consular agents abroad to inspect their passenger manifests. Elsewhere the new system of hand-picking the immigrant at the port of departure is operating without a hitch.

It must be perfectly obvious to the Mexican authorities that immigrants landing in such numbers at Vera Cruz and Tampico are ultimately destined for the United States, and that fraud will be practiced; yet apparently nothing is being done to stop them. They come right up to the border, after massing at Monterey, Chihuahua, Nuevo Laredo, Juarez and Matamoros. It is only when our immigration men catch them and attempt to throw them back that Mexico will have none of them.

That is the way we see it, but our neighbor undoubtedly sees it differently. For example, Mexican border officials claim that the new *visé* regulation imposed on Mexican nationals seeking lawful entry to the United States, added to the old head-tax law, is so unjust as to amount practically to barring them. The Texas border country has always depended on itinerant Mexican labor to harvest the autumn cotton crop and work in the irrigated valleys of El Paso, Laredo, and the lower Rio Grande where nearly 400,000 acres of land are in cultivation. The annual movement of this labor to Texas has amounted to several hundred thousand. At Laredo alone the movement for June, July, and August of 1923 was 23,464.

The wholesale employment of Mexican labor on Texas farms has been a splendid stabilizer in providing a living for the improvident peon residing along the border. It has likewise done much to break down barriers of misunderstanding and mutual distrust—it has been found that the peon, if he is improvident, is faithful and trustworthy to a marked degree. But the new *visé* regulation if continued may result in putting an end to the friendly interchange, and bring about no end of mischief—including, among other things, a revival of liquor smuggling. The native Mexican intoxicants—*tequilla, mezcal, aguardiente* and the deadly *sotol*—are easily made, easily smuggled, and easily sold; and the Mexican, like every other human being, must live.

Here is how the *visé* rule bars him: Under the old head-tax regulation it was merely required that he deposit eight dollars upon entry, for himself and every member of his household over the age of sixteen, to be remitted if he returned to Mexico within six months. It was simply a deposit of good faith: a safeguard that the literacy regulation was not being avoided. But now, under the *visé* rule, he is required to deposit an *additional* $10 (the $8 head-tax still stands) for every member of his household including babes in arms—and they always bring along the babies. The $10 is not remitted.

In most instances that is impossible. A family of ten, which is an average-sized family in Mexico, crossing to pick cotton in Texas is required to deposit $180. It cannot be done; not one peon in a hundred ever *saw* that much money. As against a three months' seasonal movement of 23,464 in 1923, Laredo's entries for the same period of 1924 fell to 7,772—and in hundreds of cases American employers advanced the money themselves because they desperately needed labor at any cost.

Mexico's failure to co-operate at her own ports has made Immigration Districts Nos. 22 and 23, covering the Rio Grande, the most important in the country from the point of natural security. To illustrate with one of a dozen incidents told me:

Last October, a ship sailing from a European port dropped 200 aliens at Tampico. They were openly bound for the United States—illegally, of course, since, under Article 23 of our old immigration law, aliens must have resided two years in territory contiguous to the United States before applying for admission. We have efficient Federal agents at Tampico. They traced this movement across the interior, to Nuevo Laredo, and the first group attempting to cross were promptly picked up by Inspector Trout's patrol.

They were a defiant lot. Their bolshevistic avowals were brazenly written on the walls of the Laredo jail—"Long live Lenin! Long live the Third Internationale! Comrades, arise!" and similar nonsense. Here was a significant thing: the inscriptions were written in excellent English.

Last year nine United States border officials were murdered. In most cases alien smugglers were the murderers. There is no more desperate crowd on the border than the *jefes* who direct the movement and the *coyotes* and guides who execute it. Six Italians attempting unlawful entry were murdered on the Mexican side, twenty-five miles from Laredo, and their naked bodies found weighted and sunk in the Rio Grande. The seventh man, left for dead, lived to tell the story. He said they had been escorted from Vera Cruz to Nuevo Laredo, carefully drilled, and then stripped to the skin, presumably to swim across. Then they were shot by their guides.

Evidence is overwhelming that the ring extends to the Old World; indeed, that it has its source there. An immigration official told me the story of a young man from the free city of Danzig, whose quota, only 228, had been quickly filled. He was first caught at Laredo in April, 1924, and sent to New York for deportation. Deportees have the choice of paying their own way back, shipping in the crew, or traveling as guests of the United States Treasury. This young man paid his own fare. A few months later he was picked up again, the second time with his wife, one hundred miles in the interior of Texas. He had returned by the same route and eluded the patrol posted at the river, but the second line of defense posted in the back country got him. He had plenty of funds and was well educated, and in a cheerful humor. When the immigration men questioned him he merely laughed and said, "I'm putting out nothing."

But sixteen Basques caught at Laredo were more communicative. They said they had shipped from Bilboa, Spain, after paying 4,200 pesetas each to a Spaniard to be delivered safely in Wyoming where they intended joining a Basque shepherd colony. They were duly landed at Vera Cruz and under escort taken to Mexico City, and thence to Nuevo Laredo. They were put across the river at night, and on the American side were taken in hand by Mexican guides who started them afoot across country. They were deserted the first night out and the next day were captured by a pair of immigration riders—penniless, hungry, frightened, and generally disillusioned.

At Tacubayo, a suburb of Mexico City, lives a Mexican lawyer who in times past specialized in forging Mexican naturalization papers at $500 each, and made a fortune. That worked excellently under our old law, but the new act makes the place of birth control the alien's status: applying for admission, he must have a birth certificate. So the lawyer went into that business, the business of forging birth certificates. He was injudicious enough to visit the border himself, and our consul at Nuevo Laredo complained, and the Mexican authorities jailed him very promptly. His occupation had come to light when a Greek applied for admission at Laredo and in broken Spanish solemnly swore he was a native Mexican—and produced his papers to prove it. He broke down under pressure and told the whole story.

Out of his own rich store of experience a veteran of the immigration service told me a story that gives a bird's-eye picture of the whole situation. It shows the ramifications of the new business of bootlegging the alien:

Calabria is a mountain-locked province lying in the toe of the Italian boot. Its people are nearly 100 per cent illiterate. But in the days before there was a literacy test, or a quota, they fared to America in large numbers to do manual labor, but very rarely to become naturalized. In 1920 a party of them returned home for a visit, and during that visit the Congress of the United States passed a strange law cutting off their return. They had remained away too long to be admitted as non-immigrants, or as domiciled aliens exempt from literacy test and quota. Besides, they were hopelessly illiterate. There was simply no chance for them. What were they to do?

Years before two brothers from Calabria had gone to France, become naturalized Frenchmen, and set themselves up in business at the famous old port of Marseilles, as steamship agents. To make the story short—how they saw the possibilities, and so on—they sent emissaries throughout Italy to look for just such unfortunates as the marooned Calabrians. The emissaries were instructed to "sweat" the American consulates, these naturally being thronged with Italian prospective

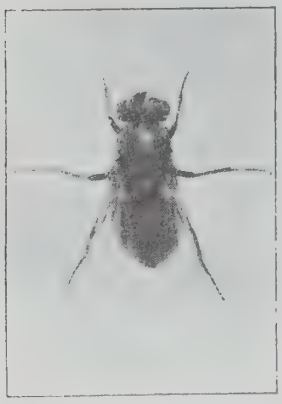
The Rising Tide of Insect Pests

Destructive Army Against Which War Is Being Continuously Waged

By WILLIAM ATHERTON DU PUY

THERE in the great pine forest on the mountain side it looks as though a fire were raging. To be sure a swath of red is running along yonder ridge. Yet this must be a strange fire, for there is no smoke and the glow has been constant for days. These trees, in fact, are not on fire. They are, however, suffering as much. They are being done to death. They are "red tops," trees with their throats cut screaming for help.



The house fly which has killed more men than all the wars.

These great monarchs are being killed by tiny dark, turtle-like insects not bigger than grains of wheat. And they are being slaughtered so wastefully! Each is dying that its persecutors may get but a few thimblefuls of food. But in getting this bit of food the tree's arteries, through which its sap circulates, are slit and the tree dies.

The pine beetle, a boring beetle, is here at work. It works in that soft layer between the bark and the wood which is the sap channel. It cuts grooves through it and when these run all around the tree it is deadened. No sap can pass up to nourish it.

The wise forester is as frightened at the appearance of "red tops" as at an actual fire. The only advantage is that he has more time to fight this menace. He goes into the forest in the winter, cuts down the trees that are affected and, if there is a stream near, puts their trunks to soak. Thus does he drown the grubs that are sleeping through to spring and keep the fire from going on. If there is no stream near, he peels the trunks and burns the bark.

There is a cousin of this bark beetle which bores into the solid wood. The result of its work is often seen in otherwise excellent hardwood that is full of holes. It is called the ambrosia beetle because of the food crop it raises in its tunnels. It is a gardener and the crop is for all the world like asparagus. It grows only in trees that are dying and whose sap is fermenting. The beetle fertilizes, plants, waters and harvests its asparagus in such trees. There is one disturbing fact in its manner of life. If it does not keep the asparagus cut that crop will overrun the place and smother it.

This fact ends regularly in a tragedy. The females, wiser than their husbands, realize that conditions favorable to their manner of life cannot long continue in this dying tree. They bore their way out and hunt a happier situation before it is too late. The males stay behind. Thus, with the population reduced by half, the asparagus cannot be kept down. It grows rank and smothers the male beetles.

Another cousin of this group is the powder post beetle. It bores in hard, dry wood and its sawdust may sift down from one's own ceiling. It attacked and ruined the beams in Westminster Abbey, in London, some years back. The hardwood handles of implements in the tool house often suffer from it. These beetles are the enemies of wood. The weevils that get into the corn meal are also beetles of the same family. Bookworms that bore holes through the volumes on library shelves are beetles. So are potato bugs. So is that most troublesome emigrant, the European corn borer, that is attacking America's biggest crop and threatening devastation. So, in fact, is that arch villain that has whipped the United States for thirty years and robbed America of her dominance in a great crop, the boll weevil of the cotton states.

Then there is the beetle flank attack, but recently made, as such things go, by the Japanese beetle which has dug itself in around Philadelphia and threatens to prove a menace many times more deadly than the boll weevil. This Japanese beetle stole a ride to America, half a dozen years ago, in the roots of certain iris plants brought over by a New Jersey nurseryman. The next year it covered three square miles, the next six square miles, then 48, then 260, then 2,500. It spreads like a widening ripple when a stone is thrown in the water. It looks as though it were destined to cover the United States.

Wherever it goes it digs in, the grubs living on the grass roots. They are particularly fond of lawns and golf courses. When they get thick they cut the grass roots as might a spade and it dies.

Finally the grubs turn to beetles the size of your thumb nail and take to the orchards and corn fields. They eat all the fruit and all the corn. If you are in the infested area, and get up early in the morning when they are cold, you can shake a tubful from each tree in your orchard. You may think that you have thus got rid of them. Next morning, however, there will be another tubful waiting for you. The state and national insect experts are stumped. They have so far been unable to halt the onmarch of the Japanese beetle.

Thus does it develop that most of the insects of the beetle tribe, characterized by the crust-like wing, are pretty dangerous citizens and likely to give man a great deal of trouble and cost him much money. The one outstanding exception is the little speckled ladybug of the nursery rhymes. She is a helper of man, renders yeoman service by eating large quantities of scale insects that would otherwise kill the plants he cultivates.

These scale insects form another group that is frightfully destructive to the crops grown by man. Outstanding among them are the plant lice, or aphids. They are the tiny insects, the giants among them but a quarter of an inch long, that are to be seen in the hearts of the roses one gathers in the summertime, or as "the blight" on many plants. They are sapsuckers and it is as such that they do their damage. Sapsucking is their characteristic trait. They all have augers with which to sink wells to the sap from which to drink. They become so numerous on plants or even great trees that they drink all the sap and there is none left to keep the plant alive.

These aphids are among the most

Above, right—These aphids are sapsuckers. When enough of them get on a plant they drink all the sap and there is none left to nourish it. Above, left—The tent caterpillar, a destroyer of foliage. Oval—The trimmings on this caterpillar are the young of a parasite fly that have lived inside it and are now emerging. These flies are helping to defeat the gypsy moth.

interesting of insects. They are, for instance, the milch cows of the ants. The ants take care of them, chase the ladybugs away, nurse them through the winter in their burrows underground, and, through the summer, take honey from them as man takes milk from his cow. When you see columns of ants marching up some great tree of a summer day, it is the milking that calls them forth. The aphids pay in honey for the care that the ants give them. Out of the abundance of their sap they refine a bit of honey. When the ant appears he is likely to find a crop of it waiting for him. He coaxes the aphid, pets it, strokes its back, and it yields him yet other drops. The milkmaid ants fill themselves full of this honey and convert themselves into thermos bottles from which other ants, engaged in other tasks, may drink. Thus do the aphids feed the ant multitudes.

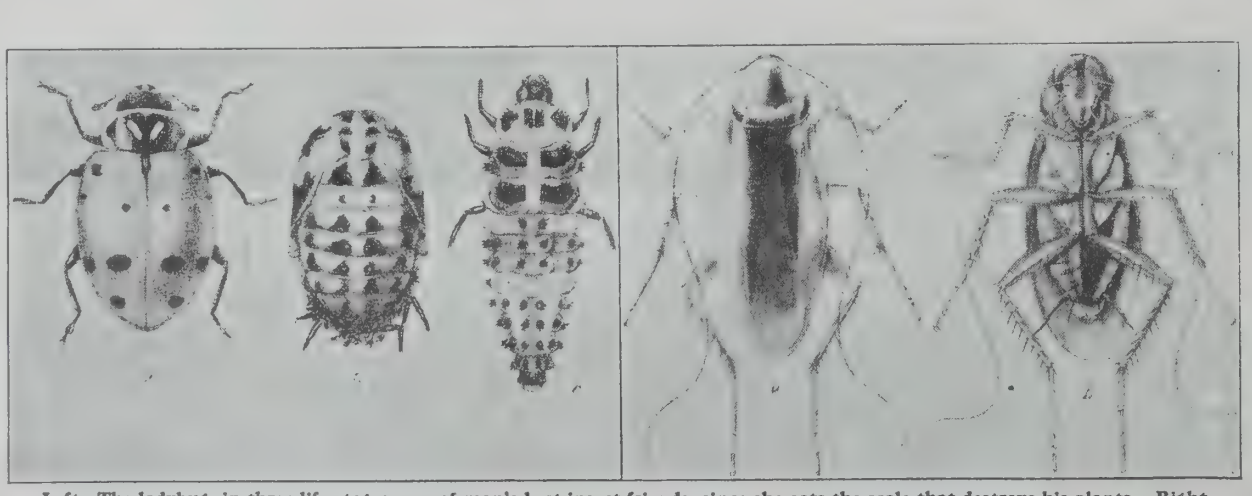
Here is another most remarkable thing about aphids. In the early spring when they first appear, there are only females. These females do a thing that is accomplished nowhere else in nature. They become mothers in the complete absence of males. They breed with inconceivable rapidity. One lonesome female in a garden on Monday may be the grandmother of millions of other females by Wednesday. This race of females keeps on multiplying in this way through the summer but in autumn, suddenly, the method is switched. There appears a generation in which there are both males and females. The females of this generation do not give birth to great numbers of tiny insects as did their mothers. Instead they lay a single egg. This egg does not hatch out until the following spring when it starts the new generation of females.

Another odd and remarkable thing about these aphids is the fact that, during the earlier generations of the season, they are wingless. They may have lived, during this time, for instance, in a plum tree. Being without wings it has been impossible for them to leave this plum tree. Within them, however, is an instinct that warns them that the time has come when the plum tree food supply is insufficient for the family. They must move to pastures new. So, of a sudden, there appears a generation that is fitted out with wings. It takes to them and flies away, perhaps to some hop field where the growing plants furnish an abundance of food. Here they settle down and breed other generations of wingless aphids. Then the hops mature. The sap is soon to stop flowing. Presto! A new generation with wings is bred and flies back to the orchard.

All of these sapsuckers are enemies to plant life. Perhaps the most frightfully destructive of them is the San Jose scale. This is the individual that has made it necessary for orchardmen in most parts of the United States to spray their trees with insecticides if they would harvest any fruit. The San Jose scale came into California, some 30 years ago, on imported trees. It has spread all over the country. It is because of it that the back-yard orchard has ceased to exist, that the fruit of the nation must be raised by scientific orchardmen operating on a big scale. This loss to the nation is almost beyond computation.

Then there is that other great tribe of insects, the scale wings, the interests of one branch of which seem almost always to run counter to those of man. The scale wings are the butterflies and the moths. They get their name from the fact that scales are laid on their wings like shingles on a roof. It is these scales, rubbing off, that leave a powder on your hand after you have caught a moth. The scale wings are divided into a day shift, consisting of the butterflies, and a night shift, consisting of the moths. It is the night shift that does the damage.

The clothes moth has always been with us, takes its toll of garments spoiled from most families at all seasons. Where it does not it levies its tax for moth balls and other methods of protection. Yet the clothes moth as an enemy is a mild creature compared with many another enemy of the fluttering night wing. There is the well-known cankerworm that assails the trees of the nation spring and autumn. There is the shabby little yellow-brown moth that is the mother of the army worm which sometimes exacts a heavy toll in the injury it does to grain crops. There is the codling moth which does its utmost to put worms in all the apples of the nation. It lays its eggs on the fruit or on the leaves near it and these hatch out into tiny worms. They know by instinct that the vulnerable part of the apple is the



Left—The ladybug, in three life stages, one of man's best insect friends, since she eats the scale that destroys his plants. Right—The American cockroach which has spread all over the world by dent of riding in ships.

What It Costs to Run Baseball Clubs

Ty Cobbs and Babe Ruths Come High; and So Do Bats, Balls and Uniforms

By PAUL MACDONALD

THE daily newspapers tell you in flaring headlines that a new world series attendance record is set, that the football season establishes new crowd marks, that more people witnessed sport in the United States during 1924 than in any previous year. You learn that more money was spent in watching sports in America last year than at any time in history. You learn that no people since the world began invest so much money for the privilege of watching others play than you and your fellow Americans. You ponder over the millions and millions of dollars that are handed over annually for tickets.

But did you ever happen to consider the cost of staging these events?

We hear a great deal of the fortunes that are handed over by the spectators but we are told nothing that concerns the cost of producing the drama of sport. News writers deal only with one side of the subject. They leave you under the impression that it is a matter of "all coming in and nothing going out."

Professional baseball and college football draw the largest crowds in sport. Each exceeded all previous attendance marks last year. The National League beat its previous record by more than 200,000 and the American League had a similar record. Yet persons who believe that a major league ball club is a "gold mine" for the owners will be surprised to learn that one National League club lost money last year and that there has not been a season in the National League when one or two clubs did not lose. The American League has a similar history and a few years ago other owners had to come to the financial assistance of one who fell so far behind that he faced retirement. One major football eleven lost money last year and will have to abandon all sports unless the alumni come to the rescue. Football is counted upon to maintain practically all the other college sports because football at most of the colleges is the only sport that provides a revenue; the others are conducted at a loss. Recently basketball began to make money at some colleges but not at all.

Let Us First Consider Baseball

Turning to the other side of the ledger, the side that the newspapers rarely dwell upon, let us first consider baseball, a game that started upon its real professional career in 1871 and has since become the best-known sport in the United States. To conduct baseball upon its present mammoth scale means huge investments. Many millions of dollars are invested in real estate and stands. The stadiums of the two major circuits alone mount into millions and the top minor leagues have also been adding brick, steel and concrete amphitheaters in recent years. Besides the money actually invested in these structures, they come rather high in the upkeep. A force of groundkeepers to look after the playing field and the stands; skilled workmen to make repairs that are needed from day to day; the clerical forces in the office, the gatemen, these require quite an outlay of money. The ball park is located as near to the heart of the city as possible, on expensive ground, and rarely covers less than a city block. This means high city taxes.

Besides these minor items there is the pay roll of the skilled athletes, the players themselves. In the major leagues there is no limit to the salary paid a ball player. The Detroit club pays Ty Cobb the sum of $60,000 a year. The New York club pays Babe Ruth $50,000 a year. They are the highest paid players in the history of sport but there are plenty of other players who get in the neighborhood of $20,000 annually. Minor league owners protect themselves by agreeing upon a certain sum for salaries each month and a certain number of players between stated dates. In the majors there is a player limit but no salary limit. A big league team can carry twenty-five men at any time but no more between set dates. It can pay the twenty-five men any sum of money it feels like paying. The two New York clubs and the Detroit club have the highest salary lists.

Some Salaries Paid to Players

It costs a heap of money to carry on in major league baseball. The New York Giants, as an example, must take in $550,000 at the gate before they can begin to count profits. The earnings of this club would be slim if it were not for the added income derived from staging boxing bouts and football games at the Polo Grounds. Across the river from the Polo Grounds is the Yankees' Stadium, home of the New York Americans. This is a larger and costlier amphitheater than the Polo Grounds and costs more money to operate. The American Leaguers miss much of the added revenue that their rivals receive. Since the Polo Grounds is more convenient than the Yankees' Stadium it secures nearly all the big football contests and boxing bouts that are held in New York.

Clubs must buy players and they do buy them—and yet here comes one of the fallacies of major league club owners. Years ago the owners decided that a big purchase price for a ball player was splendid publicity. It showed the patrons that the club loosened its purse strings to provide the best playing talent procurable. Price was no object where the patron was concerned. Naturally the owners began to exaggerate. If they paid $10,000 for a ball player they announced the price as $78,500. Then they found a comeback. If the player failed to look like a $78,500 performer the patrons criticized the owner more than the player with comment something like this, "The club's willing to spend dough all right but what the club needs is a guy at the head of it that knows how to spend money and can tell a ball player when he sees one. Why, the cash they paid for that ham would buy a pennant team." The owner made a blunder when he padded the price. But the average major league club owner is a shortsighted and stupid person.

The money spent for playing talent represents only in small degree the purchase prices of certain players. A big expense is in the search for new material. Every club has a staff of salaried scouts. From the time the first college game is played early in the spring until the professional season ends in October, these scouts roam the country, looking over collegians and then the minor league players. They spend six months every year combing the ball lots of the United States for possible talent. Scouts are expensive not so much because of the salaries they receive but because of the money it costs to send them about the country.

But the scout part of the hunt for players is only a minor bit of the general expense. Most of the major league clubs have many men on a private pay roll. They are umpires, managers, or veteran players in various minor leagues. These hired agents, good judges of ball players, write confidential reports to the major leaguers giving them inside information on the promising recruits. Any major league owner, by a liberal expenditure of money, can therefore have all the information he wants on any player in the minor leagues. He can check and re-check these various reports and get a fairly definite idea of the player's value.

What a Player Needs Most of All

According to the 1924 report of the treasurer of the National Association of Baseball Leagues, the major and minor leagues paid through the association in 1924 the sum of $2,113,408.45 in the purchase of players, assignments of contracts, drafting players and placing them out on options. Considering the vast sums invested in professional and organized baseball this amount is small; only part of it was used in the purchase of players, the remainder going for various other purposes.

Even after a player is secured the owner can rarely use him. What a player needs most of all is experience and few of the men gathered from the minor leagues ever get a regular job on a major league team the first year they report. The player is sent to one of the fast minor leagues for more experience. He is signed to a major league contract and the big league club that has him under contract loans him to the minor league club. The salary that the contract calls for is nearly always more than the minor league owners can pay and so the big league club has to make up the difference. All big league clubs pay part of the salary of minor leaguers each year.

The salary matter of the big league regulars and substitutes has been touched upon. Salaries in the majors have mounted high in recent years. There are few players today getting as low as $3,000 a season; most of them are getting $8,000 and more. Few big league clubs pay as low as $150,000 a season for the twenty-five men and coaches and managers that they carry during the pennant race. Nearly every club carries one or more outstanding stars who get outstanding salaries. When the New York Americans began paying Ruth the sum of $50,000 a year they jerked up the big league salaries. All the other stars demanded increases because of Ruth's $50,000, and they got them.

There are still other matters connected with running ball clubs through pennant races. For one thing, the balls used in play. The major leagues, naturally, use the best obtainable. They do not pay quite so much as you pay over the counter when you go to your favorite sports goods store and ask for a major league ball but they still pay more than $1 each. In 1906 the eight clubs in the American League spent $5,000 for baseballs. In 1924 the eight clubs spent more than $40,000. Each club last season spent more money for balls than the entire league spent 18 years ago, at least they averaged more because all clubs do not use the same number of balls. The National League used 3,602 dozen (or 43,224) baseballs last year, an increase of 139 dozen (or 1,668) over the number used in 1923. The major leagues tried last year to cut down the number of balls employed in presenting baseball to the American public. One reason for the enormous number of balls used was the pitching rule that demanded a ball be thrown out when it showed the least wear. This rule was passed to prevent pitchers using unnatural means to get an unusual break to their deliveries. The elimination of the spitball, the emeryball, the shineball, and all the other freak deliveries, brought this about. A ball that was soiled or scratched served the same purpose and the pitcher was able to accomplish his end without violating the rule. Since the cover of baseballs in recent years has been made of the finest leather procurable it was easily damaged. Umpires received instructions to be more lenient in enforcing the rule and to permit balls to remain in play longer. This request was observed by the umpires but it did not cut down the number of balls used.

The Purchase of Balls and Bats

The two New York teams lead the major leagues in the number of balls used. The giants last season purchased 630 dozen. Balls used in every major league game are furnished by the home club. Each club plays one-half its games at home. The New York Giants played quite a number of double-headers and taking this fact into consideration the Giants used more than 100 balls every day they played at the Polo Grounds. They spent more than $100 for balls, on an average, for every game they played at home. The record of the New York Yankees is similar. The Yankees lead the American League both in the number of balls purchased and in the number used to play their games.

Not all of the balls bought by major league clubs are used in play. There are more balls used in practice than in the actual game and there are still more given away. Some years ago someone conceived the original idea of having a baseball signed by a star for a souvenir. The idea took hold and major league clubs spend thousands of dollars every year furnishing the enthusiasts with balls signed by stars. Babe Ruth has signed as many as 60 a day. John J. McGraw has signed a similar number. And what becomes of the balls that are a bit soiled? Some of them are used in batting practice and fielding practice. Others are given away. Some are sold at a discount. Many are sent to orphan asylums.

Bats are quite as necessary as balls. The average number of bats used by a major league club is 25 dozen. These bats average $2 apiece. It costs the clubs about $600 a season for bats. This is a trifle compared to the sum spent for baseballs but even so you will wonder what any club wants with 300 bats a season and how any player can use as many as 12 bats. The 12 is just the average a player. Some use more and some less. It is true that a player can use but one bat at a time but he may try out 20 bats before he gets the one he wants. If he gets 20 bats he is likely to discard 19 of them. If a player made three hits in four times at bat in the opening game of the season, using the same bat all afternoon, you may be sure he is going to continue using that bat until he gets into a slump.

It Costs Money to Keep Them Going

Ball players believe that all bats contain a certain number of hits. They are convinced that some bats hold more hits than others. A player who is getting plenty of hits will treasure his bat above all else, soundly believing that it is the bat that is responsible for his success. He constantly discounts his own ability in favor of the bat. Take a dozen bats of absolutely the same size, make, and shape and the ball player will use not more than two or three in the lot, probably none. If he gets into a slump he will discard the entire dozen and wire to the bat factory for a new lot. Considering the other expenses of baseball the owner feels that he can well afford to humor these whims of his performers.

Clubs must also furnish the uniforms. In the American League a ruling was passed in a recent season compelling all clubs to buy two sets of home and two sets of road uniforms. The idea is to have the players looking neat and clean at all times. If they happen to play on a rainy day and on a muddy field, the uniforms are sent to a dry cleaner that evening and the club looks spick-and-span in a new set of uniforms the next

Nottingham, Merrie England's Hub

Near Here Are "The Dukeries" and the Haunts of Bold Robin Hood

By PAUL TYNER

NOTTINGHAM is one of the livest towns in the Midlands of England and impresses one as very up-to-date and businesslike. It is the seat of the lace and hosiery industries. Many of its buildings are on what would be considered a large scale, even in Chicago. Its post office, stock exchange, town hall and a score or more of banks, insurance offices and office buildings, university and schools, to say nothing of its factories, are of imposing architecture. Then there are the big railway stations, theaters, hotels, churches, palatial cinemas and massive stone bridges spanning the lordly Trent.

Despite its modernity in these respects—and the town's population is nearing the half-million mark—the voyager in search of the historical and picturesque finds Nottingham a center of absorbing interest. Short trips by autobus take one through Sherwood Forest, the haunt of Robin Hood and his merry men whose exploits are made familiar to present-day Americans by the film in which the spry "Doug" Fairbanks has so lately scored a big success. Once in Sherwood Forest, one is easily tempted to go a little farther afield, and see Newstead Abbey, the ancient home of Lord Byron, passing on the way through "The Dukeries," a stretch of splendidly wooded manors in which no less than five ducal domains meet. Nowhere outside England are seen such well-kept park lands.

But Nottingham's pride is Nottingham Castle, no less for its present beauty and usefulness, and their relation to the everyday life and work of the community, than for its ancient historical associations. The castle is an institution and a landmark that would confer distinction on any city.

In the article on Durham Castle, was pictured the meeting of ancient and modern in the transformation of a medieval fortress into a twentieth-century university. Nottingham Castle presents the same sort of antithesis in its evolution. What for centuries had been a famous military stronghold is now the City Art Museum. What is more, it is a model, in my humble opinion, of what a modern art museum should be.

We have here no mausoleum of mutilated marbles and dusty "old masters," no storehouse of headless and legless torsos, noseless Apollos and armless Venuses; no splintered and fragmentary Jupiters and Minervas. Here no phantasmagorias of color spread over acres of canvas perpetuate more or less accurately this or that painter's conceptions of how historical personages possibly looked, or the artist's idealizations of famous battles and other events with more or less fanciful admixtures of symbolism and allegory.

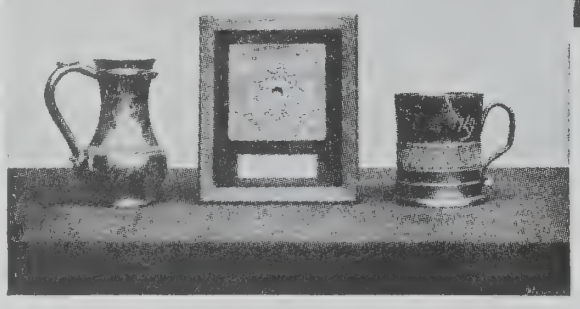
Not that Whistler's symphonies in blue or silver, or pink and yellow, or the charming landscapes of Corot and Millet, have not their place. There are a number of persons who need these helps to see the beauty of a sunrise or a sunset and to appreciate the play of light and shade and tint and form in nature offered to us all in the changing appearances of sea and sky, field and forest, lake and river, mountain and valley.

One reaches the castle in an easy five-minute walk from the Market Square in the heart of the town by a narrow and winding street lined with ancient shops and dwellings and leading by a gradual ascent to the castle gates at the foot of a broad flight of steps that rise to the beautifully kept lawns and gardens that surround an immense brown sandstone building in the Gothic style and occupying the crest of a plateau commanding extended views on all sides over the city of Nottingham and the beautiful countryside of the Trent valley.

The site seems to have been appreciated from an early period for its command of the southern passes of the Trent River. Saxon and Danish fortifications preceded the famous fortress built here in the year 1068 by William the Conqueror, to hold the heart of England in subjection. The man he placed in command was William Peverill, a name that will remind lovers of Scott of "Peverill of the Peak." In this royal castle, an important council was held by Henry I in 1109. Between this date and 1153, the Castle changed hands several times in the internecine wars of the period.

It was in 1153 that Henry, Duke of Normandy, afterward King Henry II of England, granted the castle and town of Nottingham to Ranulph, Earl of Chester, who was subsequently poisoned by one of the Peverills. Some twenty years later, King Henry gave the castle to his son, Prince John, and spent vast sums on its strengthening and extension.

Richard the Lion-Hearted, however, retained the castle in his own hands on coming to the throne, and until 1191, when, during his absence on a Crusade in the Holy Land, it was surprised and captured by John whom Richard Coeur de Lion found defiantly living there on his return to England. The King promptly sent an army to besiege the place, but John and his beleaguered followers held out for months until Richard himself joined the besieging force, when it fell after four days' vigorous bombardment. A few years later, John, having been pardoned by his big brother, was allowed to return to Nottingham and even after ascending the throne he continued to make the castle his favorite residence. It was here, indeed, that King John perpetrated one of the blackest deeds in English history when he hanged the twenty-eight Welsh boys he had been holding as hostages for Prince Llewellyn.



Above—Nottingham Castle Gate. At left—Nottingham pottery. Above, at right—English state carriage, 1698.

Throughout the remainder of the Middle Ages, Nottingham Castle remained one of the most important of the royal fortresses, large additions to the original building being made during the thirteenth century and the place becoming the scene of many important councils.

Perhaps the most romantic event transpiring here—and the one out of which the visitor today gets most thrills for his "thruppence"—was the dramatic surprise and capture of Earl Mortimer, the lover of Queen Isabella. The Queen and Mortimer had sought refuge from the jealous ire of King Edward II in Nottingham Castle, as a place of impregnable strength and security. But they fell victims to the treachery (or loyalty from another point of view) of the deputy governor, who informed the King, then only 18 years of age, of a secret passage leading from his house without the walls into the heart of the stronghold.

The King, fiercely determined on revenging himself, personally led a party of armed men up the steep and rocky passage on the night of October 19, 1330, surprising and capturing Mortimer after a short struggle. The execution of the unhappy Earl a month later at Tyburn marks a point in the nation's history. Going today through this dim, dank, dismal and rocky tunnel, since known as "Mortimer's Hole," one could easily imagine the scene of Mortimer's capture and realize the emotions of the lovers so rudely torn apart—one to die on the scaffold, the other to eat out her heart in grief and despair, a prisoner of state in London's dread Tower.

During the reign of Henry IV, Owen Glendower (son of the Welsh chieftain of that name) was confined in the dungeon of Nottingham Castle after his capture by Henry, Prince of Wales, in 1411, and was taken thence to his death in the Tower.

The castle's greatest splendor was reached in the reign of Edward IV (1461-1483), who built a great square tower at the northwest corner of the middle bailey, now the site of the Castle Green, and a whole new range of state apartments in the more comfortable, not to say luxurious, style of his time. Further additions were made by Richard III, who set out from Nottingham Castle in 1485 for the disastrous battle of Bosworth Field which is immortalized in Shakespeare's play. And from this same stronghold, a few years later, his successor, Henry VII, marched to the battle of Stoke.

The castle had fallen into a state of neglect and decay—possibly through royal apprehension of the power for mischief that possession of such a stronghold placed in the hands of recalcitrant nobles—when, in August, 1642, it became identified with an event of prime importance, not only in English history but in the clash between monarchism and the rising tide of democracy the world over which formed a sort of prelude to the birth of the American Republic. Here Charles I raised his standard at the beginning of the civil war between Royalist and Parliamentarian, Cavalier and Roundhead. The standard was raised on the top of the Castle's highest tower, but, being blown down by the wind (ominous circumstance), was hoisted again, this time on a hill outside the walls. Shortly afterward, the castle was captured and garrisoned by forces of the Parliamentary party under Colonel John Hutchinson, who held it throughout the war. Following the execution of Charles after the trial at Whitehall, in which Hutchinson figured as one of the judges, he incurred Cromwell's displeasure by dismantling the fort.

This Hutchinson, by the way, was the progenitor of a notable Massachusetts family. Only a few years ago, I had a most interesting talk in Salem, Massachusetts, with old John Hutchinson, eldest of a family of eight brothers and sisters, who for years traveled up and down the land "singing in the freedom of the slave."

These Massachusetts Hutchinsons played a conspicuous part in the Abolition movement, and may be regarded as its minstrels, often obtaining the ear of the public for their songs when its more fiery apostles were denied a hearing.

On the occasion of my visit, John Hutchinson had just entered his eightieth year, but was still hale and hearty, his head crowned with a thick thatch of snow-white hair, while a flowing white beard emphasized the benevolence of his noble features and winter-apple complexion. His blue eyes flashed as he recounted certain reminiscences of the anti-slavery pioneers, his colleagues, Theodore Parker, Wendell Phillips, Lyman Beecher, William Lloyd Garrison, Lydia Maria Child, Lucy Stone, and Harriet Beecher Stowe. In a voice that was still remarkably full and clear-toned, he sang for me "Bold Harry of the West," a campaign ditty in praise of Henry Clay. The last survivor of this interesting singing band, John Hutchinson, had then recently celebrated his seventy-ninth birthday by the gift to his native city of a beautiful park.

When I asked the secret of his vigorous old age, he smiled and said sweetly: "I breathe and I hum!" suiting the action to the word by taking a full deep breath and humming an old ballad on its exhalation. It's not such a far cry, after all, from Nottingham in Old England to Salem in New England!

What the seventeenth-century Hutchinson had left of Nottingham Castle was demolished by order of Cromwell's Council of State. After the Restoration, the estate was granted to William Cavendish, first Duke of Newcastle, an ardent royalist and a man of great wealth who had shared the exile in France of the Stuart princes. He it was who built the present castle in a style more suggestive of a French chateau than of an English fortress.

It was five years in building, being completed in 1679. Above the principal entrance on the east front, facing the town, may still be seen the mutilated remains of an equestrian statue of the first duke, who was a great authority on horsemanship and author of a treatise on the subject. This mutilation of his statue took place when the castle was attacked and its interior burned by a mob during the Corn law riots.

During the Revolution of 1688, this new building was the scene of an historic event which may have had much to do with the change of dynasty following on the expulsion of the Stuarts and the bringing of William of Orange to the English throne.

On learning that William had been invited to England by the Protestant party, the Princess (afterward Queen) Anne deserted her father's court in London on the persuasion of the Duchess of Marlborough (the clever and intriguing Sara Jennings) and fled to Nottingham Castle, where she resided until the Valiant Dutchman, with his wife (her elder sister Mary), became joint sovereigns of England. When James heard the news of his daughter's adhesion to the party opposing him, he is said to have burst into tears and exclaimed: "God help me; my own children have forsaken me!"

After 1795, the Dukes of Newcastle do not appear to have favored their Nottingham residence, and in 1831, during the disturbances throughout the country over the Reform Bill and the demand for the repeal of the Corn laws, the building was entered and set on fire by a mob as already described. Although the interior was practically destroyed, the exterior, thanks to its solid masonry, was comparatively uninjured. But the building was left a ruin for 40 years or so until in 1875 it was taken over by the Nottingham Town Council, restored and adapted for use as the "Museum of Fine and Decorative Arts." The museum was opened on July 3, 1878, by King Edward and Queen Alexandra (then Prince

Booklegging in the Nineteenth Century

By CAPTAIN ELBRIDGE COLBY

THE rum fleet was once a book fleet. Instead of evading the laws, the invaders came with full sanction of law. Carrying volumes in portfolios instead of bottles in boots, they legged it across the Atlantic to provide what America could not furnish. Theirs was "high grade stuff"—far superior to the "home brew" of local amateurs. The pirates on the high seas of the nineteenth century were book pirates.

In St. Paul's Churchyard, London, were agents who seized the first volume off a British press, snatched page proof or galley proof if they could, and dashed madly for the waiting packet. A race across the seas! A quick delivery! And an American printing shop turned out the works of Edgeworth, Byron, Dickens, Austen, Scott, or Thackeray, in such plenitude as to satisfy the bookish thirst of the American reading public. In 1825, a Philadelphia firm received advance copies of some cantos of "Don Juan"; thirty compositors set to work immediately and in thirty-six hours an American edition was on sale. For his work of capturing the ideas and fixing the imaginative concepts, the British author received nothing in the way of royalty. The text was pilfered. In one instance a Waverly novel was even stolen from the Constable storeroom—burglary of the material volume as well as of the intangible genius, burglary committed to save time. All the New York, the Boston, or the Philadelphia publisher wanted was to get a few hours start on his competitors. With the name of a British author on the title-page, the book had an assured sale. If the sale were taken quickly, the profits were big. But the British author got no satisfaction in the form of compensation. And the nearby American authors in the vicinity of the printing shops could not stand the competition: his need for payments nearly put him out of the field. What publisher would pay for an American book when he could cheaply pirate a good British book? Said a Philadelphian to William Gilmore Simms in 1841: "We do not see much hope in the future for the American writer of light literature—as a matter of profit it might be abandoned." Said Lowell: "We steal Englishmen's books!" Said Poe to Lowell in 1844: "How dreadful is the condition of our literature! We want two things certainly:—an International Copyright Law, and a well-founded monthly journal." The second was soon to come, with the establishment of the *Atlantic Monthly*. The first, the international copyright, had to wait until nearly the end of the century.

All through the eighteen hundreds the merry races went on. Look at your Stevenson or your Kipling or your early Hardy novels. How many volumes on your shelves were pirated? William McFee tells of purchasing in a department store a cheap paper-bound Conrad, pirated like the rest. Under such circumstances, the wonder of it is that Irving, and Hawthorne, and Cooper, and Poe, and Gilmore Simms managed to gain any audience at all. Is not all of this really a reason for the outstanding position of the intellectuals and superior culturists of Boston in the annals of American literature? What they wrote was not light literature. It was "high-brow" stuff. And beyond what they wrote, only things with a distinctively American scene or an American flavor seemed to survive at all. It was cheaper to pirate British books than to pay an American author, cheaper to print a foreign novelist who was sure to sell, than to print an American embryo genius whose volumes might clutter the storerooms indefinitely. The publishers, being human, turned their attention toward the quick turnover.

Occasionally there was some slight inclination to pay the pilfered Londoner for his far-sped fiction. In 1829, Washington Irving wrote to William Godwin:

> "If you can furnish me with a manuscript copy of the earlier part of the work, and supply the subsequent part in sheets as struck off, so as to give some bookseller in America the decided start of his competitors, I think it highly probable I can get something for it to repay you for your trouble."

Yes, there was an inclination to pay, but it was not for the work, merely for the "decided start of his competitors" that the publisher was willing to make disbursements. A publisher of Mrs. Browning's poems proudly announces on the title-page:

> "From the last London Edition, Corrected by the Author."

Further attempts to assume an authenticity in regard to American editions are indicated in the following note to another volume:

> "AUTHOR'S EDITION.
> Having received what I consider to be sufficient remuneration for my poem of 'Aurora Leigh' from Mr. Francis, of New York, it is my earnest desire that his right in this and future editions of the same, may not be interfered with.
> "ELIZABETH BARRETT BROWNING"
> London, Oct. 21, 1856.

Still, the United States was not then more moral than it is today. The spiritual heights of literature were as perverted as the spirituous liquor smugglers. Right through the customhouses they came, boldly; and as boldly opened and advertised their stolen wares. Though now the dilution is with water so as to make a single Scotch commodity into four or five, the expansion in quantity then was by means of printer's ink and cheap paper, and a single pirate book was duplicated thousands and thousands of times into a large edition. All that, too, without contribution to the prosperity of Bermuda, Havana, or the Bahamas, or raising any question as to "continuous voyage." It was in 1842, of books and not of bottles, that Charles Dickens wrote:

> "The more you see of this plunder and the dirty hands into which it goes, the more you will feel and advocate the necessity of a change."

The change was to come with the passing of time and the enactment of new legislation. Yet still the work went blithely on. There were doctor's prescriptions in those days, too, material sent through as it were in bond, bearing a validating label like the following:

> "It is my earnest wish that with Messrs. Ticknor and Fields alone the right of publishing my books in America should rest.
> "ALFRED TENNYSON."

When the change came, it was a change indeed. The infantry industry of American letters took a sudden boom. In the nineties and the early nineteen hundreds, there came a deluge of American fiction. We had the romanticism to get out of our systems; and the imitations of foreign styles and foreign traits. Once freed from the bookleggers and the state of the public law, it took some time for a true American spirit to be evidenced in our literature. The competitive effect of cheap English books had stifled and scattered and localized our own efforts. Only with the progressive twentieth century is America beginning to take a substantial place in the sunlight of the world of books.

Avoiding Pitfalls in Tourist Camp Sanitation

By DR. OSCAR DOWLING

THE automobile, the modern magic carpet, has brought with it many problems, among them one having an important bearing on the public health.

By helping to increase the amount of travel it has also increased the opportunities for spreading disease. Insanitary conditions which in olden days might affect only a small group in a small community now have grave potentialities. They may cause typhoid fever, for example, in the person of an auto tourist, who then may leave a trail of infection over many miles.

With the development of auto tourist traffic has come the establishment of tourist camps which invite the traveler to tarry awhile and enjoy the hospitality of the community.

Such camps vary from mere vacant land which offers nothing but parking space to those which furnish not only essentials but such conveniences as shelter, heat, light, and even provisions for doing laundry work and for recreation.

Two fundamental essentials for such camps are: a safe water supply and sanitary disposal of the body wastes. No camp is worthy of the name which does not furnish these. The water supply may vary from a simple well, properly built and wisely placed, to a supply from a city purification plant equipped with the most modern devices, operated by competent men under the supervision of skilled scientists. The waste disposal system may vary from the simple pit privy, properly built and wisely located, to a water carriage sewerage system with ultimate disposal of the sewerage by modern biochemical methods. But whatever the degree or style, these provisions can be, and must be, safe and sanitary. Else the camp, instead of being a mark of the community's hospitality to a stranger within the gates, becomes a snare and a delusion. Let me say here and now to a community about to establish a tourist camp: Don't do it at all, unless you can do it right.

To be sure, to do it the right way may cost some money. Not much if the provisions are simple, perhaps a considerable sum if all the desirable conveniences are provided. Any health department will gladly give details for construction of wells and toilets, and many are in a position to provide for inspections of camps and camp sites and for tests of water supplies, so it will not be attempted in this short article to give a treatise on camp sanitation.

As to providing for the cost of camp arrangements and camp maintenance, and it is sad but true that unless supervision is provided the maintenance will most likely not be sanitary, it is considered that the auto tourist, no more than anyone else, need not expect to get something worth while for nothing. The auto camp should be self-supporting. A moderate fee charged to campers will not only help to pay for maintenance, but will help to make a permanent camp in a place intended only for transients. Additional revenues can often be obtained by selling franchises to filling stations, and so on.

Of course, no system of tourist camps, camp sanitation and board of health regulation can take the place of common sense and some knowledge on the part of the tourist himself. All is not gold that glitters, and everyone should know that not all water, be it ever so clear and sparkling, is fit to drink.

Tourists should investigate the quality of the water they get. The supplies of most cities are good. Some state boards of health are testing roadside supplies and posting notices announcing their quality. Such signs may be accepted. Wherever there is any doubt about the safety of a supply the water should not be used, or should be boiled before using. The tourist should also bear in mind that a certain amount of responsibility devolves upon him. Too often the traveler in leaving behind the cares of home or business leaves behind as well the social amenities of life and does things he would not think of doing at home. Aside from such obvious things as respecting the property of others, particularly fruit and flowers, refraining from littering the landscape with paper, tin cans, and so on, it should be borne in mind that practically all states have in their codes something which meets the exigencies of such cases as these.

A knowledge of the principle of first aid and a first-aid kit should be part of the equipment of every auto tourist. One should learn how to take care of his own physical well-being and provide the needed equipment.

What It Costs to Run Baseball Clubs

Concluded from page 11

afternoon. These uniforms, four to each man and 100 to the team, cost $25 each when bought in big lots. The clubs buy them and the clubs pay to have them cleaned. Also, the clubs provide heavy sweaters or jackets for the players to protect them on chilly days. These cost from $15 to $35 each, depending upon the style the club prefers. About 30 are purchased each year, for the chilly days come in the spring and the autumn, at the beginning and end of the season, when there are from five to ten recruits on hand for early and late trials. The players buy their own underwear, gloves, shoes and shoe laces.

The foregoing information gives a fairly accurate account of the money spent by the two major leagues, but baseball is not confined to the two major leagues. The major leagues form less than one-thirteenth part of organized baseball. When the season of 1924 started there were 28 minor leagues in the United States and Canada. These 28 leagues embraced 202 towns and cities. Then there were numerous leagues playing three and four games a week, numerous twilight leagues playing practically every day, and any number of semi-professional and shop leagues. These are all outside of organized baseball, rather outside the National Association of Professional Baseball Leagues. But it costs money to keep all of them going. The minor leagues last year employed 6,123 players. They spent more than $20,000,000 in salaries. They spent another fortune for bats, balls, uniforms, traveling expenses, executives, clerical forces, building expenses, and repairs.

It costs well over $100,000,000 to play baseball before paying patrons in the United States each year. No one knows how much more. The sum may be twice $100,000,000. Considering the many sources of expenditure, the amount rises to staggering proportions.

Smuggling Aliens

Concluded from page 9

immigrants seeking consular *visés* and information on the state of the quota.

In April, 1922, Vera Cruz began to fill with Italians who were said to be bound for farm tracts in Mexico for colonization purposes. That, of course, was a blind they had used in getting by the Italian immigration authorities back home, since Italy does not grant passports to its subjects until they can show they are not attempting to enter any country illegally, and have never been accused of crime.

From Vera Cruz the movement worked its way to the Rio Grande, in small groups, finally uniting at Matamoros, opposite Brownsville. They applied to the immigration authorities for transit privileges to Canada; were denied; and crossed the river by stealth. They were apprehended, given hearings, and deported.

Five Calabrians told what had happened to them. A representative of the Marseilles steamship agency had come to their village and made this offer: that for 5,000 lires he would guarantee passports out of France *viséed* by the French and Mexican authorities; and a safe landing anywhere in the United States. They were told that the steamship agency had branches all over the world and was so rich and powerful as to be able to put them on trains and carry them to destination without stealth and without interference.

Five accepted the offer and paid 25,000 lires—in advance. They were taken to Marseilles, added to a growing company, and in due time landed, first at Vera Cruz, then Mexico City, and finally Matamoros—shepherded every foot of the way. When the "transit privilege" strategy failed they were taken from a Matamoros hotel at night, with several hundred companions, escorted on foot up the Rio Grande to a point opposite Fort Brown, put across in skiffs, loaded into automobiles and carried to a neighboring town, and then instructed openly to buy railroad tickets to San Antonio.

The movement was positively expeditionary. Of course, it created a furor. Immigration men swarmed to the scene.

Despite its checks, the business of smuggling aliens across Mexico goes on, and grows larger. But at the same time the defensive strategy of our immigration men is getting to be more and more effective. The net draws closer day by day. It is an interesting thing to watch, how these devoted men do their work along the fitful, far-away Rio Grande.

In next week's DEARBORN INDEPENDENT Mr. Bentley will describe the work of the mounted immigration patrol on the Mexican border.

The Rising Tide of Insect Pests

Concluded from page 10

eye at the end. Here they bore in, feed until they are mature, crawl out again, having quite spoiled the apple, and go into the cocoon stage to live through the winter. The fruit growers fight these moths by spraying their trees carefully, trying always to get some of the poison in the bud end of the apple so the worm will get it when he starts boring.

There is, of course, the well-known case of the attack of the gypsy moth, introduced from Europe, on the trees of New England and the 50-year war to check it. There is, finally, that recently arrived pest, the peach moth, just now becoming an outstanding menace, threatening to wipe out the peaches of the nation.

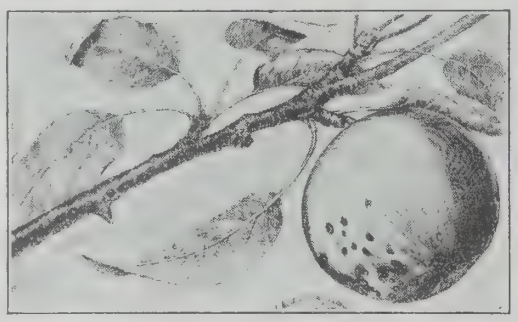
The arrival of the peach moth was spectacular. She came in on the flowering cherry trees that the Empress of Japan sent to Mrs. William Howard Taft, a dozen years ago, and which, growing about the Tidal Basin, are the springtime glory of Washington. She got in, despite the fact that the cherry trees were fumigated with more than usual thoroughness. She sleeps so soundly in her cocoon, it seems, breathes so little, that poison fumes do not kill her.

A parasitic fly laying its egg in the cocoon of a tent caterpillar.

It was not known that she was here for some years after the cherry trees were planted. Then she began to appear in orchards about Washington and was traced back to her origin. It was demonstrated that she was an importation, a native of Japan.

When the air-tight cocoons of the peach moth hatch out in the spring, the moth immediately starts laying its eggs in the twigs of trees. When each egg hatches, the larva crawls out to the tender tip of the twig, eats in through the bud, and starts down through the pith of the hollow in the twig where the going is easy. It thus blights the twig, puts it out of business. Each larva is likely to blight three or four twigs before it spins its cocoon and goes to sleep. It does not take many of them working thus to quite ruin a peach tree.

Later, when the twigs are no longer tender, there is the fruit itself which is satisfactory food for the grubs. They begin to bore into the peaches when they are half-grown causing them to become defective. They attack them when they are nearly ripe and penetrate to the seed. During years of their abundance they make all the peaches in the orchard wormy. They spoil the crop. They do not limit themselves to the peach trees but visit around among the pear, cherry, and quince trees. They cannot be successfully fought by spraying as are the codling moths because spray is not effective on the fuzzy skin of the peach. So far they have baffled the experts. The battle with them is one of the vital new issues in America's contest with the insect.



Different phases of the San Jose scale which has driven out the small orchard.

Insect enemies are innumerable and there is one broad fact that begins to stand out as the study of them progresses. It begins to be demonstrated that the insects, in a world dominated by man, have peculiar advantages. As man remakes the world in his own interest he fixes it likewise as a better place for the insects. The boll weevil, for instance, amounted to nothing in its native haunts in the Mexican mountains. Given unlimited food supplies by the broad acres of cotton which man planted, however, it spread like wild fire. The gypsy moth in its native haunts in Europe never made much of a stir. When brought to America, released in her virgin forests, freed from certain enemies of its old home, it rolled on like a tidal wave. The Colorado potato beetle, native of the Rocky Mountains, never amounted to much. It did not have the food supply to make it powerful. Man, coming into its native haunts, planting vast acres of potatoes, gave it its chance. The Japanese beetle and the peach moth were unimportant insects in the Orient, but, brought to America, they found an opportunity they had never known before.

The spread of the cockroach, under man's inspiration, is one of the outstanding romances of the insect world. It is an odd thing that the cockroach did not exist in Europe until ships began going to the Orient for spices. These ships returned from India filled with innumerable black bugs. The Spanish called them "cucarache" which meant "wood louse." Hence the name cockroach. The liking of the cockroach for warmth and narrow, dark spaces fitted it ideally for traveling about the world in the holds of ships. Thus this fellow from India came to all the ports of the world and from them spread to the houses of man wherever they are found. Later, another variety of cockroach, a little fellow, arrived in Europe by way of Germany and came to be called the German cockroach. It came to New York at about the time the Croton reservoir and water system was completed and Gothamites thought that it came through the pipes. They therefore called it the Croton bug, also the water bug. Today it has a place in most of the pantries of the nation. Two other species of cockroach came to light in widely different parts of the world, one in Australia and one in America, this last the biggest of them all. They, too, have been carried all around the world in ships. Thus it has come to pass that all the cities of the world now have or soon will have, thanks to the activities of man, four varieties of these kitchen pilferers.

All of this is quite aside from the ravages of insects as carriers of disease, is apart from the menace of the flies through typhoid, the mosquitoes through malaria, the flea through bubonic plague, the tsetse fly of sleeping sickness fame, which prevents the development of Africa, and many others. I have here been speaking of those insects only which take material toll of those supplies upon which man depends for his well-being.

Man is suffering stupendous material losses through insects—greater losses than from any other agency. His own activities create favorable opportunities for the insects. Those enemies of man are gaining ground.

Almost anything may happen in insect land. There may today be some tiny, obscure, unheard-of insects in the back lands of Patagonia, of Mongolia, that tomorrow may be ravaging man's stores in Melbourne or Minneapolis. Appreciating which possibility, such progressive governments as that of the United States are scanning the insect horizon with much interest.

Importing Animal Diseases

FEDERAL veterinary officials exercise painstaking care to exclude animal diseases from abroad. Fragile articles such as china and novelties imported in great quantities require careful packing. In the past the packing has been, for the most part, hay and straw. Such packing material originating in a country where foot-and-mouth disease exists, may carry infection; consequently the official regulations now require the destruction of foreign packing material of that kind upon arrival from a country known to be infected, unless the shipments are accompanied by certificates of approved disinfection issued by the American consular officers in the country of origin.

As a further means of tightening the quarantine against animal diseases from abroad, the Bureau of Animal Industry reports success in efforts to have straw and hay replaced by packing of non-agricultural origin. Excelsior, shavings, sawdust and paper are used largely in the new packing, and shippers have gladly co-operated with the officials in replacing the dangerous germ-laden packing with the new product. Hides and skins, that are to be imported, receive a very thorough disinfection, and every possible precaution is taken in connection with the importation of animal by-products and animal feed.

On December 12, 1924, the Board of Health of New York City declared an embargo upon the shipment of live poultry from the states of North and South Dakota, Kansas, Indiana, Illinois, Iowa and Nebraska. This was done as a consequence of the outbreak of a serious disease which apparently had its origin in the states mentioned. It is believed that Dr. V. A. Moore of Cornell called the attention of the United States authorities to the existence of the disease which he is said to have diagnosed as European Fowl Plague, a malady which, as far as is known, never existed before in the United States. Others say the disease was nothing more than infectious bronchitis, a disease that is not uncommon in all parts of the country. When the disease was at its height thousands of chickens were killed daily in the cars by health officers at the live poultry market in the Jersey City yards. At the time this embargo took effect the cold storage people had an immense stock on hand for the Christmas trade. These chickens and turkeys were put into storage at about 22 cents a pound. Immediately upon the declaration of the embargoes on poultry the price of turkeys jumped and kept jumping until it reached 44 and 45 cents a pound. The storage men made a rich killing and the poultry raisers of the Dakotas, Kansas, Indiana, Illinois, Iowa and Nebraska lost out.

Nottingham, Merrie England's Hub

Concluded from page 12

and Princess of Wales). Interesting marble statues depicting Edward and Alexandra as they then appeared adorn the entrance hall.

One may still traverse the old secret underground passage of "Mortimer's Hole" and view the dungeon as it existed in the days of the Plantagenets. Steps cut in the rocky hillside lead down into the old moat, now filled with shrubbery. At one end of the grounds is preserved a section of the old city wall that goes back to the days of the Roman occupation, and in the museum itself is preserved a number of prehistoric and British-Roman objects, weapons, tools, utensils, and so forth, dug up near the old wall.

The great brick ovens of the castle, built in James the Second's day, now form an exhibit in the Textile Room which occupies what was the kitchen of the castle, while in the main hall are many specimens of decorative lead-ware in the form of rain-water pipe-heads, pump fronts, well-copings and panels, besides several fine garden vases mounted on pedestals and an Elizabethan oak doorway that long formed part of an old house in Bottle Lane, Nottingham, destroyed in 1864. These old builders built better than they knew!

Certain it is that the enthronement on this commanding site of a civic institution owned and controlled by the community and free to all—an apotheosis of the town's chief industries and a central feature of the municipality—fitly succeeds to dominance in the landscape, and in the life of the people, the earlier symbols of monarchical rule and the sway of a military autocracy.

Symbol of the new spirit also is a majestic modern edifice that rises just outside the castle gates on the town side and whose many windows look across to its pleasant grounds with its statues, shrubbery, and fountains. This is the Nurses' Memorial Home and embodies Nottingham's very sensible war memorial. In place of the usual marble or bronze column, arch or statue, it embalms the memory of the heroes who fell in the war in the shape of a permanent home for the most overworked and underpaid professional women in Britain, a home where between hospital and other engagements they may live comfortably and conveniently at nominal cost.

In the south court of the building are two interesting examples of the seventeenth-century coach-maker's craft. One is a state carriage and the other is a post-phaeton built for Thomas Baskerville, High Sheriff of Wiltshire in 1698. Not far away stands a traveling carriage built for use on the Continent at the beginning of the nineteenth century and the sumptuous state carriage of the Viscounts Galway built about 1800 and last used on the occasion of the coronation of the present King George V.

A sedan chair—from which the design for these early swinging state carriages was obviously drawn, as was that of the later stagecoach from the private carriage, and the English railway compartment of this present day from that of the stagecoach—stands nearby with two early bicycles, precursors of the present-day safety bike and, it might be argued, of the modern motor car.

The great distinctive feature of the museum is the Textile Gallery, containing not only a rich permanent collection of laces and embroideries, but also of typical machines illustrating the evolution of the art of machine-made lace and hosiery from the first crude hand frames and pillows to the modern lace machine—a marvel of intricate and delicate adjustment.

About a quarter of a century since a prominent and wealthy Nottingham lace manufacturer became a follower of John Alexander Dowie, noted in his day for his declaration that he was a reincarnation of the Prophet Elijah and for his sensational and effective religious propaganda. This Nottingham man was persuaded by Dowie to cast in his lot with the Dowieite community. He dismantled his Nottingham factory, took all his machinery to America and set it up as the central industry in that curious community, "Zion City."

The European situation is found to be as directly responsible for the stagnation of the Nottingham lace industry as it is for the distress among the cotton operatives in Lancashire, the coal miners in Wales and the North of England, the cutlers and toolmakers of Sheffield, and in the potteries of Derbyshire and Staffordshire.

Yet the Nottingham folk, despite all this hard times talk, struck me as remarkably cheery. Optimism is in their blood and they are able to get some fun even out of the "industrial depression" of which one hears so much. Consciously or unconsciously, they are practical psychologists, always looking on the bright side, expecting better things to turn up and willing to turn them up with pick and shovel if necessary. Like the hero of James Whitcomb Riley's verse, remembering that every cloud has a silver lining, they believe in "wearing their clouds inside out."

"I see," said a visitor in the coffee room of the County Hotel, "that a writer in this morning's *Guardian* declares Nottingham's lace industry has dropped to the lowest ebb in its history."

"Splendid!" rejoined a Nottingham man. "You know when the tide has ebbed a turn is due and the flow-tide begins. Now we are going to have the most prosperous season the trade has ever known—and we had better get ready for it."

That sort of spirit will take a lot of crushing. It cannot be kept down very long. It should be said that much of this optimism may be traced to Nottingham's institutions. The very influence of the castle on the heights conveys a sense of strength and stability. Then there is the great open market where consumer and producer meet without the costly intervention of the middleman. Not only fruits, flowers and vegetables in great variety, but also poultry, rabbits, eggs, butter, cheese, honey and jams, beef, mutton, ham and bacon, to say nothing of clothing, pottery and chinaware, may be had in this market at astonishingly low prices.

The Marvels of Zion City, Illinois

Voliva Calls It "a Theocratic Government" and It Works Very Well

By WILLIAM A. M'KEEVER, A.M., LL.D.

TO WORK diligently day by day, without felt pressure from above; to play spontaneously but in a manner conducive to health and morals; to have social fellowship, but always through clean and aspiring contacts—these are three of the great, age-old concerns which seem best suited to shape the destiny of mankind. Zion City, Illinois, with its 5,000 inhabitants, claims to have entered upon this tremendously significant course of human progress.

"A theocratic government," Wilbur Glen Voliva, the General Overseer, calls it, and he himself is the theocrat. He conducts all the affairs of Zion in his own name, never makes use of anything like a board of directors, appoints the Apostles and the Managers of the various departments, and does so because he regards himself as having been divinely called to take over this one-man government.

"The Christian Catholic Apostolic Church in Zion" was founded more than thirty years ago by the late John Alexander Dowie, who, after a brilliant and spectacular career, passed away in the midst of the seeming defeat and break-up of his institutions. Before finishing his career, however, he had purchased more than 600 acres of land at a point 50 miles north of Chicago and had laid out the nucleus of Zion City. After his death, there came bankruptcy and disorganization. The news press jested with his once-brilliant project and the entire affair seemed about to fade out of existence. Fortunately, as his successor, he had appointed the present General Overseer, who seems to possess business ability sufficient for a railway system or a banking corporation and at the same time the elements of a successful religious leader.

When Mr. Voliva took over the affairs of Zion everything was in the hands of a receivership. The industrial institutions, poverty stricken and dismantled, were all offered on the general market to the highest bidder. The General Overseer himself was found, by a committee appointed to investigate his worth, to be in possession of 83 cents. Not being permitted even to hold meetings on the Zion tract, he pitched a massive tent on some leased ground outside, paid $100 a Sunday for free taxicab service for all comers and conducted revival services in his original manner. The members of his flock rushed to his aid with prayers, with acclamations of joy and with contributions of money that were amazing.

It is too long a story to be told here but there can be little doubt that Mr. Voliva has conducted a brilliant and successful business enterprise as well as an astounding all-round human enterprise. He has fought successfully nearly three hundred lawsuits, involving millions of dollars, and has never been fined more than one cent. He has purchased from the receivers the original Zion tract and holdings for a sum of $950,000; has invested other vast sums in the repurchase of the industrial plants—excepting only the lace factory—has established some three dozen business institutions on a paying basis, causing them to earn about $3,500,000 a year and has made the entire citizenship of Zion apparently happy, healthy, and prosperous. As reward for all this seemingly miraculous achievement, Mr. Voliva receives no salary, only an allowance for himself and family, up to the present maximum of $250 a month. No drug stores, no medical doctors, no pork, no tobacco, and no daily newspapers—these are the astonishing situations which are found in this modern theocracy at Zion City, Illinois. Out of a record of 1,000 infants born during the last sixteen years, only three have been lost at the time of birth. Prayer alone is resorted to for healing the sick. It was my privilege to see an industrial employe step out of his place and go aside with one of the Apostles of the church, where prayers were offered for the recovery of an infected hand.

Here we find one of the most complete printing plants in the country, setting a goal of $700,000 in business for this present year. There is one of the most complete, well-equipped bakeries and confectionery plants in the country, with a business extending over a very wide territory. The handkerchief and apron factory, the general store, a banking institution and others that could be mentioned, all show a net business that indicates a satisfactory degree of business confidence. At the beginning of work every morning, the employes of all the industrial institutions are assembled in their respective "Prayer Rooms" for brief religious worship. For one minute, at 9 o'clock in the morning and again at 9 o'clock in the evening, every member of Zion stops wherever he is for prayer.

The school system of Zion consists of all the traditional grades, including a four-year college course, but is not what our leading educational critics would rank as "strictly modern" and "scientific" in standard. The Bible is taught in every grade, from kindergarten to college graduation. Since literal interpretation of the Bible is made and many of the accepted conclusions of medicine, physiology, and the like are disavowed, the texts and methods in the schools are made to conform to Zion's belief. However, Mr. Voliva has invested $25,000 in a modern gymnasium and has encouraged play and recreation among the young.

Mr. Voliva's manner seems to be somewhat that of the beneficent despot. He calls his people together for a series of meetings and Bible lessons on Sunday and has his auditorium filled to capacity with 4,000 hearers at the main meeting in the afternoon.

Socially, jazz does not exist. There is no dancing and nothing which the most prudish individual might regard as injurious to morals. Social life is expressed through the frequent mingling of the people at school, gymnasium, playground, church, and in the industrial institutions. Since the employes in the plants are all well paid, there being no labor unions or lodges of any kind to cause the usual Capital-Labor disturbance, every one seems to regard himself as being on a brotherly basis with his associates.

Zion is modern enough to have gone into the radio broadcasting field. Its station, WCBD, sends out General Overseer Voliva's sermons on Sunday nights, and he is listened to by tens of thousands because of his remarkable, forceful, and clear-cut enunciation and equally because of his hard-hitting method. He is one of the few speakers who can get real oratorical effects over the radio.

The transmitting room of this broadcasting station, like those of other centers, contains heavy curtains hung from walls and ceilings. These deaden echoes and eliminate outside sounds. A pick-up instrument, or microscope, mounted on a standard, conveys the voice or music into a laboratory-like room containing various pieces of electrical apparatus, such as transmitting vacuum tubes, panel boards, storage batteries, and so forth. Here the music or voice is amplified by means of vacuum tubes which increase the volume of the sound waves thousands of times. This amplified sound then enters another bank of vacuum tubes, called modulators of the electric waves sent through the other. Many stations employ from 500 to 1,000 watts of radiated energy, that is, the electrical power delivered to the aerial.

Chinese Bandits Wreck and Loot a City

(Concluded from page 6)

There are people in Nanking today who proudly claim descent from the kings of Wu, which is sort of putting one over on the several thousands of Americans who proudly claim their forbears came over on the small ship *Mayflower*.

Nanking just now is quiet, and to a measure content. The Chinese merchants are hard pressed, for the China New Year is almost here—it comes January 24 this year—and in China a man pays his debts on that day; otherwise he is disgraced or commits suicide. The soldiers who have been so long idle about the city have brought but little trade to these merchants, and the well-to-do townspeople have bought but little here, where the best goods of the merchants have been hidden to protect them from expected looting ever since the Kiangsu-Chekiang war ended in October. The wealthy class, generally speaking, have stayed right in Shanghai, waiting for peace to come once more to Nanking.

And so it is the comparatively few who watch for the coming of the China New Year in 1925 with the usual spirit of glad anticipation. War is just what Sherman said it was, and it makes no difference in what part of the world it comes. Wars in China have come with such regularity and so frequently for so many centuries, that one wonders that there is a smiling face left in the land.

Yet it is a happy land, and it seems that the poorer and lower classes are the happiest. The coolie, the hardest worked, poorest paid and most downtrodden of them all, is seemingly the happiest. A few coppers a day will fill his rice bowl. He knows no other want. He was born to freeze in winter and roast in summer, so why worry because the winds are chill now and he is dressed in rags? Next summer will be as hot as today is cold, and there is no need to kick. Of course, he does not reason this all out, for he is a coolie and not born to reason. He is born to take the place of a beast of burden, and to be glad that he has strength enough to perform his duty. For to work means, if he is fortunate, to eat. To eat and sleep is a coolie's measure of happiness.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. The set includes: "The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

The Pathans of the mountains of Afghanistan live without schools, police, lawcourts, taxes and, free from the chains of civilization, enjoy the blessings of barbarism.

Certain African tribes paint their bodies white as a symbol of mourning.

The speed of the waves was measured on a trip from Southampton to Trinidad. It varied from one mile an hour to a little more than eight miles an hour.

Some 50,000 passengers have flown across the English Channel since the Armistice, most of them traveling in British machines.

"You can see a much cleaner show today in a burlesque house than on the legitimate stage. There are three clean musical shows in Chicago that are 'turning them away.' They are drawing bigger houses than any smutty show ever got."—*Fred Stone,* famous comedian.

Gas warfare was not unknown to the Spartans, who in 431 B. C., in besieging the cities of Belium and Platea, burned pitch and sulphur under the walls of the cities to break down their defense by suffocating the defending troops.

The first American flag ever exposed to enemy fire was that floating over Fort Schuyler, near Rome, New York, on August 2, 1777.

Sixty billion cigarets were smoked in the United States in 1924.

Windows in York Minster, England, have not been washed in more than 600 years.

An interesting court scene was recently enacted in Chicago in a personal injury case in which the plaintiff, after four physicians had testified that he was hopelessly paralyzed, threw down his crutches, and, walking about the room, revealed that he was an investigator for the defendant railroad, and charged that he had conspired with an attorney to obtain a verdict fraudulently.

It cost twenty times as much to recruit the 2,400,000 men who fought on the Union side during the Civil War as it did to recruit the 4,800,000 raised by the United States in the late World War.

A device which sends out wireless distress signals from ships automatically has been invented. The S O S. call and the latitude and longitude of the stricken vessel are given.

The Binet intelligence test proves that boys from Hindu, Mohammedan, and so-called outcast families are as intelligent as are the boys of the Brahman caste.

President Coolidge had a new suit made in Newburgh, New York, in a union shop, and each garment bears the union label, according to the *Garment Worker.*

Rabies were known even in Aristotle's time, he having written an article about the disease.

A recent ice crack in Lake Mendota was so severe as to shake all the buildings along the lake front, including the great University of Wisconsin library.

An average of seven or eight earthquakes are recorded weekly at the Hawaiian Volcano Observatory.

Celibacy was punished at Hilton in Dorset, England, in the eighteenth century, the register of the parish in 1739 showing that all unmarried persons more than 17 years must either serve in the army or pay a fine.

No son of a Yale graduate will be refused admission to Yale if he passes the examinations.

Moslem shepherds of Morocco wear a long strand of hair on the otherwise shaven head. By means of this strand the Faithful hope to be pulled up to heaven.

The Basque gypsies contracted their marriage by throwing a jar toward the sun and counting the fragments.

The leaning tower of Pisa, Italy, is in danger of entirely toppling over. A deep trench dug more than a century ago about the base permits infiltrations of water which soften the earth causing it to yield under the weight.

Playing horseshoe on Sunday was forbidden in Lincoln, Nebraska, as late as 1920.

The Knights of the Garter in England were preceded by Knights of the Round Table, which fell in desuetude after the new organization was started.

Cows in Holland are kept in pastures by ditches of water instead of fences.

About 20 per cent of the rural population of Russia is now enrolled in co-operative enterprises.

Due to a process called compensatory growth, if one kidney of a dog is removed, the remaining kidney will almost double in size within four or five weeks.

Due to the weather last year, the female flowers on England's hazelnut bushes blossomed before the male flowers, resulting in a crop failure.

Gorillas and all the animals of nature native to the region are protected in a tract of territory 250 square miles in area in the Belgian Congo State.

Girls herding ducks or geese is not an uncommon sight in certain parts of Europe.

An eighth of the deaths in the registration areas of the United States are caused by heart diseases, this being the most common cause of death.

Practice with the bow and arrow on holidays was compulsory in London in 1309, Edward III requiring that each man own a long bow of his own height.

"I Read in the Papers—"

I read in the papers that Great Britain has passed air estimates involving an expenditure of $107,596,500, and that the home defense air squadrons are to be increased to 25. Is Britain going to rule the air? There is a Greek myth, antedating the Christian Era by many years, which says that Daedalus, an Athenian, was banished to Crete for murder, and that while there he designed the Labyrinth, that strange maze of intricate passages from which no one could escape except by flying upward. Daedalus got into trouble with Minos, the prince of the country, who caught him in his own trap, as it were, by casting him into the Labyrinth. Here the engineering skill of Daedalus came into play, for he designed a pair of wings for himself, and a pair for his son Icarus, and while Daedalus escaped to Sicily in safety, Icarus flew too near the sun and, melting the wax of his flying machine, took a nose-dive into the sea. Here is a lesson, thousands of years old, which politicians and flying men might well ponder.

I read in the papers that Charles G. Dawes, Vice-President of the United States, grabbed a big broom and made a vigorous attempt to sweep away a large and varied assortment of cobwebs from the Senate chamber. In doing so he raised considerable dust, but when the air had cleared it was evident that something had been done which had enlarged the vision of most of the members. The Senate has been so much wrapped up in tradition that it has treasured its cobwebs rather than otherwise, and Mr. Dawes' vigorous action has shocked the sensibilities of some of the slumbering legislators. But, as the Vice-President expressed it, "under the inexorable laws of human nature and human reaction, this system of rules, if unchanged, cannot but lessen the effectiveness, prestige and dignity of the United States Senate." Some sage of the past wrote that "rules were made but to be broken," but Mr. Dawes evidently believes that rules were made to be revised, and that the revision has sometimes to be drastic. The Senators gave him "a slap on the wrist" in acknowledgment of his zeal, but in return it is not unlikely that there will be some get rapped on the knuckles.

I read in the papers that the Ontario legislature has voted in favor of 4.4 per cent beer. This means that although the plebiscite which was taken at the end of last year gave a majority in favor of the continuation of the Dry laws, the intent and purpose of the Dry laws is to be largely defeated by the manufacture of a beverage which will maintain a benevolent neutrality, as it were, in regard to the whole question of Prohibition. If this new law is confirmed, it is quite possible that the term 'near beer," formerly so popular, will be changed to "almost beer." Moreover, a proposal has been made that the price of this "almost beer" will be fixed "so that," as one of the speakers expressed it, "when our American friends come over, as we hope they will in large numbers to have their thirst assuaged, they will know what they have to pay." This solicitude on the part of the Ontario government is quite affecting. Premier Ferguson says that this beer enactment is "necessary in the interests of *temperance.*" This suggests a new cross-word puzzle: "Is Ontario Wet or Dry?"

I read in the papers that someone had heard the "first robin," and I am safe in saying that for the next few weeks the advent of "first robins" will be read in the papers by a good many other people. There are some people who would like to have the distinction of having heard the "last sparrow." This refers to the English or European variety which is by no means universally beloved. It is in fact the Ishmaelite among birds; but, nevertheless, according to holy writ, we are told that the Lord of all living creatures exercises a benignant care over this "bird of low degree." I have been told that some people during those cold winter days have been putting out crumbs to feed the hungry sparrows, and I met a man who said that he liked to hear their cheerful twitter when the skies were drear and all other feathered things were absent. After all, there is good in everything, if we but look for it.

I read in the papers that "Mussolini's power remains unshaken while his foes falter." Opinions regarding the Italian dictator considerably differ according to the source from which they come. Stable government cannot be maintained for too long a period by the aid of guns and bayonets, clubs and castor oil. The ax and rods of the fasces were "good medicine" during the régime of the Caesars, but imperialism cannot flourish on the soil trodden by Garibaldi. The return of constitutional government to Italy, or "normality," as Mussolini loves to call it, cannot be long delayed.

I read in the papers that an old-timer who has developed many properties in the interior of Alaska called recently on the second assistant postmaster-general with a plan for re-routing mail so as to give the Chisana district a once-a-month mail service. Chisana is a river valley lying between the Nutzotin and Wrangell Mountain ranges. The second assistant postmaster-general informed the old-timer that, "if he didn't like it in there he didn't have to stay." This seems to be the accepted attitude adopted by bureaucratic Washington toward those who are battling against odds to wrest wealth from the frozen North—and increasing national wealth so that these same chair-warmers may more cozily toast their limbs while they help themselves to another piece of cake. We agree with the Alaska weekly which would like to drop one of those gentlemen down in the Chisana with a can of Carnation, a chunk of dog-fish and a handful of raisins, and tell him, "Now rustle, confound you, you may get a letter from home about June if some sourdough is kind enough to bring it in to you." If he returned safely he would be a more courteous public servant.

THE DEARBORN INDEPENDENT

Entered as Second-Class Matter at the Post Office at Dearborn, Michigan, under the Act of March 3, 1879. Additional entry at Chicago, Illinois.

By the Year $1.50 | Published Weekly | Dearborn, Michigan, March 28, 1925 | 25th YEAR No. 23 | Single Copy Ten Cents

MR. FORD'S page deals this week with the pleasure that may be derived from excursions into the haunts of Nature; the riches of the countryside. (p. 7)

THE second installment of the story which tells of the assassination of Lincoln and its consequences will be found to be of particular interest. Just what happened after John Wilkes Booth fired the fatal shot has been wrapped in confusion by irresponsible writers. Here is the story in a concise and clarified form. (p. 3)

JUST how young people regard the approach of age, and their attitude toward aged people generally forms the theme of Luther Burbank, whose knowledge of plant life may have led the way to his intimate knowledge of the human plant. Some people regard age as a doubtful blessing; but there are others who do not. (p. 2)

THE surprising influence which the Jew has acquired in the affairs of Central Europe is not generally known. It is not realized that when Shylock is "stacking the golden hay" he may also be monopolizing the rays of the sun which give life to the rest of mankind. We are told on good authority what a good harvest he has got out of Germany. (p. 4)

THERE is romance even in the most prosaic of things, if the telegraph can be so called. Some of the greatest inventions have not reached their goal without a struggle. How Morse perfected his scheme for the transmission of messages by electricity is an epic in perseverance. (p. 9)

LAST week we told of the difficulties that have to be encountered in putting down the "bootlegging" of immigrants into the United States via Mexico. In this number some interesting details are given of the work of the mounted rangers who patrol the banks of the Rio Grande. (p. 12)

FLORENCE E. ALLEN is an associate Justice of the Supreme Court of Ohio. She is of the opinion that decisions in courts of law should be grounded on facts rather than on prejudice as expressed by the emotions. She considers, among other things, that "there is too much emotionalism in the conduct of our government." An interview with this lady unfolds some other interesting opinions. (p. 10)

IT HAS been said that the history of Canada is the history of the Hudson's Bay Company. Certainly the "Company of Adventurers" to whom Charles II granted a charter had nothing in mind but the making of profit for themselves by the sale of furs. But unconsciously the project was the means of doing some valuable pioneering work which laid the foundations of Canada's prosperity today. (p. 13)

THERE is much talk nowadays about the big sums that are made by professional players in various games, and the colossal receipts that are taken at the gates. But against this there has to be set the enormous expenses of the sports organizations. This week there appears the first part of a story by one who has an intimate knowledge of this. (p. 14)

ONE of the outstanding humorists of the present day is undoubtedly Will Rogers, the ex-cowboy who varies his entertaining patter by his skill in the manipulation of the rope. (p. 5)

Youth, and How It Looks Upon Age

Some Regard Age as a Doubtful Blessing, But Age Has Its Compensations

By LUTHER BURBANK

Robert Louis Stevenson said, in speaking of happiness, that, "The pleasure is in the journey rather than in the arrival." This might be paraphrased by saying that "Pleasure lies in anticipation rather than in realization." But in this article Luther Burbank, the great trainer of plant life, gives us some new thoughts on the matter. As a keen observer he has seen that age has its hours of gladness no less than youth, and that when a certain milestone has been passed the desire is to live still longer.

IN MY journey through life I have often had occasion to marvel at the manner in which youth looks upon age. Little children always want to live to be old and confidently expect to reach at least 90. But when they pass the age of 10 a change comes to them. Age does not look so good. They seem to regard old people as they might regard cripples or invalids. They are to be treated kindly, apparently because of their supposed disabilities, but they are not envied. Children who are still romping and playing recoil a little from a period of life from which all romping and playing have gone.

I once knew a young woman who had such an aversion to age that she vehemently insisted that she did not want to live to be more than 40 years old. She held to this idea all through her twenties. During her thirties she did not say so much about it. Apparently she passed 40 without knowing it and now, as she is approaching 50, she is as certain that she would like to live to be 100 as she was sure, as a young woman, that 40 years would be enough for her. But she is as much of an exception to the rule now as she was when she was young.

When "Luther" Had Not Enough to Eat

Most persons regard great age as a doubtful blessing.

I cannot speak from experience about great age. My mother, who lived to be 97, was able to do so, but I who am only 76 cannot. I have lived long enough, however, to become convinced that our ideas about the relative values of different periods of life are all wrong. We glorify youth—after it is ended. We belittle age—before we reach it.

What is so wonderful about youth? Both my experience and observation indicate to me that it is the hardest time of life. I am not now speaking of school days, though they are hard enough, but of the days and years immediately following when young men and women are suddenly pushed out to sink or swim in a world that they know little or nothing about. I almost died at this period of my life. I am alive now only because a kindly old lady in Santa Rosa, California, where I have lived ever since, rescued me. I had been working for a pioneer nursery man in Petaluma, a few miles away, and sleeping over the greenhouse. I had no escape from the hot, humid atmosphere of the greenhouse either night or day. Incidentally, I did not have enough to eat. I gradually grew weaker and finally came down with typhoid fever.

I came back to Santa Rosa to convalesce and this old lady saw me.

"Luther," she said to me one day, "you don't look to me as if you had enough to eat."

I was too weak to enter into an argument and so admitted that what she said was true.

"I am going to send you a quart of milk every day," she added. "I want you to use it."

I was glad enough to drink it. A quart of milk came every morning and I noticed that she had mixed cream with it. I picked right up and was soon well again.

What boy who goes away from home to make his way in the world does not run out of money, at least once, and go hungry for a few days or weeks? Of course, such an experience does one no permanent harm, provided it is not too long continued, but it is far from pleasant, and it is but one of a multitude of hardships that come to young men who have to fight the world for a foothold and don't know how to do it.

When the struggle is ended and the battle won, men and women are prone to look back to youth and idealize it. They decorate it with rainbow trimmings, forget all the storms, and imagine that the sunshine was a thousand times nicer than it was. But when one forces his mind back into the past, and with determination goes about it to dig the very truth out of his recollections, it comes to him clearly that *at no time when he was young did he think he was having such a glorious time.* He recalls that life was very hard. More than likely he floundered about a good deal before he found something that he could do. While he was floundering he was perhaps discharged several times because he did not fit the niche into which he had tried to place himself. Youth, too, always has to contend with low wages and the scale of living that accompanies them.

Youth Travels on Its Illusions

Youth travels on its illusions. If it were not so it could not stand the struggle. Belief in the things that are not so is what keeps it going. Youth believes certain things are coming that are not coming, and is glad. Youth sees a world so full of good things that it seems necessary but to choose what it will have.

This leads to dreaming of the future. Youth dreams and muses of the days to come. And over these dreams is sprayed the seductive incense of mystery. In this world of wonders what has fate in store for the particular young man who is doing the dreaming? Of course, some day he will be married. Who will be his wife? Inasmuch as she will naturally be about his own age, she must be somewhere now. Right now, within the last two seconds, she has breathed! But where is she? Heaven only knows. And that is what makes the dreams of youth so intoxicating. They are shot with mystery and confidence. Life cannot fail. It must come through with a great prize package.

Youth finally finds work that it can do, gets its feet on the ground, marries and sets out to conquer the world. When one looks back at it, this period seems pathetically humorous. Nobody ever conquered the world. Nobody ever can conquer it. The most that anybody can do is to conquer himself—to shift his vision from the things that are not worth while to the things that are.

Pursue Purposes That Are Worth Pursuing

This is life's greatest and only worth-while task. Only to the extent that we accomplish this do we accomplish anything.

This is not a pleasant task. It is very, very hard. It is hard because most of us have to be beaten and clubbed by circumstances to convince us that we are on the wrong track. We want to pursue purposes that are not worth pursuing. We want to be what is not worth being. In our ceaseless search for happiness, we go to springs that have no water and chase rainbows that have no end.

Thus we spend what are generally regarded as our best years—the latter part of youth and all of middle age. By that time, most persons have learned that happiness can be gained only by letting one's own soul out into the sunshine. I use the word "soul" not because it fits definitely into my thought but because, when used, it has a meaning that is understood. I mean we should do the things we want to do, provided the doing of them harms neither ourselves nor invades the rights of others. We shall not always know what we want to do, but only by trying shall we ever learn. At least we have a right to try. Happiness often comes from doing what one does not want to do, but that is only when one's luck is better than his judgment. If judgment, as a rule, be not a better guide than luck, one's place, it would seem to me, is in an institution for the feeble-minded, rather that in the outside world.

As one becomes older he looks down upon the world as if from a mountain height, sees the struggle from which he has emerged, and wonders what it is all about. So many little men, hurrying here and there, on so many little tasks! In a little while they will all be dead, but for the moment they seem not to realize it. What it is all about nobody knows. We know only that it is life as it appears on this planet.

Something That Exists in the Past Tense

What keeps us going? What force is it that drives us on? What are we trying to get?

We are trying to get happiness. Nothing else. Schopenhauer called the force that drives us on the "will to live," but I think it is something more than that. I think it is the will to live happily. We want to live but merely to live is not enough. We want to be happy.

And what is happiness? Nobody knows exactly. As far as my experience and observation go, happiness is something that usually exists only in the past tense. Almost nobody is happy *now*, but everybody can tell of innumerable occasions when he *was* happy. We are not necessarily happy when we laugh. More likely we are only amused. I doubt if deep happiness ever wears a smile. It is too penetrating for that.

This elusive thing that we seldom recognize until it is gone is the thing we are all pursuing. Wherever we go it seems just around the corner and we quicken our steps to catch it. Always it is just ahead or just behind us.

If we would stop it would catch us, more than likely. Often, when we stop, it does. That is why people, as they grow older and cease pursuing happiness, find more of it. Nothing is more certain than that happiness cannot be outfooted, waylaid, tied hand and foot and put among one's other possessions. When men set out to accumulate fortunes they try to outrun happiness—and they fail. I read a little while ago the statement of an eastern insurance company that the percentage of suicides among millionaires last year was higher than in any other class of our population. Baffled in their "will to live happily" they chose not to live at all.

The Older We Grow the More We See

In every normal person the will to live grows stronger with the years. One may philosophically reconcile himself to death, but he nevertheless does his best to keep from dying. Strangely enough, the will to live is weakest in youth. The young are careless of their lives. Even if middle-aged and old men could do it, does anybody suppose they could be induced to go up in airplanes and do such stunts as the young do? They have learned to value life too highly to risk it unnecessarily.

My mother who, as I have said, lived to be 97 years old, used to say that the years she spent in California, during the latter part of her life, were the happiest of all. I believe that most old persons, who are well and in comfortable circumstances, enjoy the latter part of their lives the best. I know I do. Every year is better than any that preceded it. I enjoy life because I am doing what I want to do. Money is not the incentive. As far as that is concerned, I could be idle the rest of my days. I work because I enjoy what I am doing.

Robert Louis Stevenson was right when he said, in speaking of happiness, that "The pleasure is in the journey rather than in the arrival." I am quoting from memory, not from text, but this was the substance of it. The older we grow the more clearly we see that life is not what in youth we supposed it to be. The goals for which we set out are seldom reached, but instead we are ushered into a good many places that we did not have on our maps.

In my opinion, the element of surprise in life adds much of zest and charm to it. Life would soon become dull if we knew, from the beginning, just what was to happen to us.

I know, because, when I was a boy I had the peculiar faculty of knowing, to the smallest incident, just what was going to happen during the day. It was as if a curtain were raised and I were given a full view of the immediate future as far as it pertained to me. This faculty did not remain with me long and I am glad it didn't. The days of which I had been given a preliminary view were the dullest days of my life. Life became flat because, knowing what was coming as I did, it contained no surprises.

What Edison Said About His Body

I think it would be a good thing if the young would associate more with the old and I know it is a good thing for the old to associate with the young. In Santa Rosa some of the older people have organized what they call the "Borrowed Time Club," meaning thereby, of course, that nobody is eligible who has not reached the age of 70. They elected me an honorary member of it but I never have visited it. There is a woman in Santa Rosa 91 years old who feels about the club as I do. Her pal is her great-granddaughter. This old lady lives at a hotel and other guests cannot believe it when they are told her age. She does not look a day more than 70 and is very spry even for that age. She has a son 71 years old who is often mistaken for her brother.

I hope every younger person who may read this will believe me when I say that for all such "the best of life is yet to come." The body will have lost much of its strength, but what does that matter? Remember what Mr. Edison says of his body—that his only use for it is to carry his brain around.

All of us live "upstairs" if we only knew it.

It is the faculty of youth to derive pleasure from the putting forth of physical powers, but it is no less the faculty of age to derive pleasure from the use of the mind. A mind that has been properly employed never grows old. Give a mind things to feed upon, keep it in touch with the world, and it remains forever young. And if it be coupled with a youthful heart, nothing about such a person is old except his body. And that does not count.

How Lincoln Met Death

The Second Installment of This Series Gives the Story of the Assassination

By F. L. BLACK

Booth in the act of leaping out of the box to the stage, after shooting the President. From a contemporary print. His spur caught in the flag that was draped in front of the box.

THE identical flag lowered at Fort Sumter on April 14, four years before, was raised at the hour of noon over the battered fort by General Robert Anderson, who had been in command when it was lowered. The Civil War was over; the North victorious. In Washington the week had been one of constant celebration. The feeling of the North cannot be better expressed than in an editorial, "The Dawn of Peace," which appeared in the New York *Daily Tribune* on the day of Lincoln's assassination.

* * * *

"The path of Peace opens pleasantly before us. There may be thorns in the way as we advance, obstacles to be removed, pitfalls and snares to be avoided, but we look back to the dread road we have traveled for four long and weary and painful years, and the road before us smiles only with summer sunshine.

* * * *

"It is a moment only for rejoicing. The hours of despondency—how many we have passed through!—the fears that courage, or strength, or resources might fail us, have passed away. The good fight has been fought; the Right has triumphed. We are a Nation, no longer divided against itself, but one, indivisible, united, FREE.

* * * *

"The war is over. The house is to be set in order, but the cause of disorder exists no longer. Within the week the President has issued two Proclamations giving notice to the world that we are not now a distracted household, that the nations are to conduct themselves accordingly, and cannot again be permitted to take advantage of our disturbed condition. . . . The dispensation is over, the new era begun! The throes, the pains, the tortures of birth are finished. A new world is born, and the Sun of Peace rises in splendor to send abroad over the land its rays of warmth and light! Never before had nation so much cause for devout Thanksgiving; never before had a people so much reason for unrestrained congratulation and the very extravagance of joy."

* * * *

Into this picture steps the assassin—

The story of the assassination of Abraham Lincoln could not be more clearly and graphically told than from the testimony given under oath at the trial of the conspirators held in Washington, May 1 to June 30, 1865, the trial of John A. Surratt, June 10 to August 10, 1867, and the impeachment investigation of Andrew Johnson by the House of Representatives in 1867.

The incidents leading up to the assassination began with General Grant's order in April, 1864, prohibiting the exchange of prisoners between North and South. The most serious need of the Confederacy was man power. Consequently, the liberation of southern captives in northern prison camps became the goal of expeditions organized by Confederate agents both at Richmond and in Canada.

John Wilkes Booth, an actor and the son of an actor noted for his eccentricities, had achieved his stage successes in the South and was completely in sympathy with the southern cause. With a sense of theatrical values, Booth, as early as August, 1864, conceived the idea of kidnapping President Lincoln and carrying him to Richmond as a hostage. To carry out this purpose he recruited other southern sympathizers, four of whom paid the death penalty for their part in the affair. All attempts at kidnapping proving fruitless and being deserted by some of his confederates in the plot, Booth decided to abandon further attempts.

As far as can be ascertained from the testimony the first definite resolve by Booth to assassinate Lincoln was made on Tuesday night, April 11. Booth had arrived in Washington from New York, Saturday, April 8, and on this Tuesday evening, accompanied by Payne, one of the conspirators, he listened to President Lincoln's speech given from one of the White House windows to a crowd assembled on the lawn. According to Payne's statement, made before his execution, Booth became enraged when the President said that he favored the elective franchise for the more intelligent Negroes, and "he tried to persuade me to shoot the President while in the window," but Payne claimed that he told Booth he "would take no such risk; and Booth remarked: 'That is the last speech he will ever make.'"

Let us account chronologically for the principal characters taking part in the tragedy:

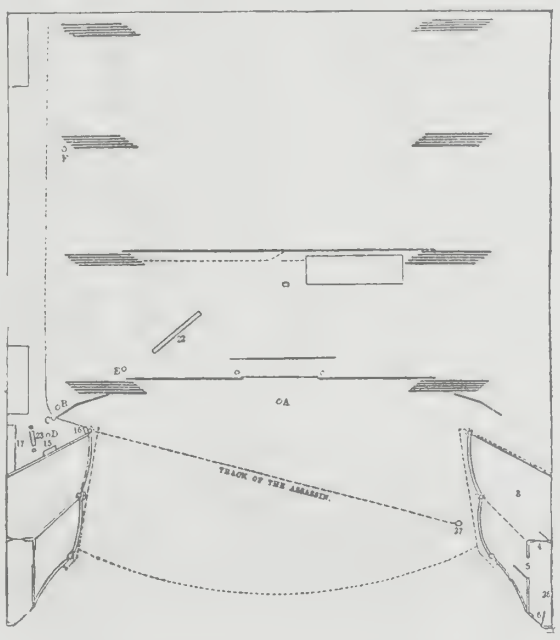

Diagram of the stage at time of assassination. Twenty-nine persons were passing and repassing upon the stage and through the passages at the time the assassin crossed it and dashed for the rear entrance.

A—"Asa Trenchard," (Mr. Harry Hawk.)
B—Miss Laura Keene.
C—Mr. Ferguson.
D—Gas Man.
E—Stage Manager, (Mr. Wright.)
F—Mr. Wm. Withers, Jr., (Leader of Orchestra.)
3—Box of President.
4—Door to box.
5—Door to box.
6—Entrance to passage.
16—Prompter's desk.
26—Hole in the wall, to fasten door, (three feet six inches from corner.)
27—Torn place in carpet, (two feet from lower box where Booth landed.)

David Herold, the conspirator captured with Booth, according to the Washington *Star* of April 22, 1865, was "talking to friends in front of the Metropolitan Hotel on Wednesday (April 12) of last week."

Wednesday afternoon, Atzerodt, the conspirator selected to kill the Vice-President, ascertained the location of Mr. Johnson's room at the Kirkwood House. On Friday, the fourteenth, before 8 a. m. he registered and was assigned a room there, although he had put up previously at the Pennsylvania House whenever in Washington.

After firing the fatal shot, Booth exclaimed, "sic semper tyrannus!" On Thursday morning, the day before the assassination, he asked another guest at the National Hotel whether "tyrannus" was spelled with two n's or two r's.

The testimony of C. D. Hess at the conspiracy trial covers all the known activities of Booth on Thursday afternoon.

"I am manager of Grover's Theater, and I have been in the habit of seeing John Wilkes Booth very frequently. On the day before the assassination he came into the office during the afternoon, interrupting me and the prompter of the theater in reading a manuscript. He seated himself in a chair, and entered into a conversation on the general illumination of the city that night. He asked me if I intended to illuminate. I said yes, I should, to a certain extent; but that the next night would be my great night of the illumination, that being the celebration of the fall of Sumter. He then asked, 'Do you intend to' or 'Are you going to invite the President?' My reply, I think, was, 'Yes; that reminds me I must send that invitation.' I had in my mind for several days to invite the Presidential party that night, the fourteenth. I sent my invitation to Mrs. Lincoln. My notes were usually addressed to her, as the best means of accomplishing the object."

Booth's last letter to his mother bore the Washington, D. C., post office stamp, dated April 14 and was headed, "April 14, 2 a. m."

On the morning of the fatal day, about 9 o'clock, Booth had a hair cut at a barber shop near Grover's Theater. We now follow his actions as covered by the testimony of H. Clay Ford and others:

"On the 14th of April last I was treasurer of Ford's Theater. I returned to the theater from my breakfast about half-past 11 o'clock that day, when my brother, James R. Ford, told me that the President had engaged a box for that night. John Wilkes Booth was at the theater about half an hour afterward. I do not know that the fact of the President's going to the theater that night was communicated to Booth, but I think it is very likely he found it out while there. I saw him going down the street while I was standing in the door of the theater; as he came up he commenced talking to the parties standing around. Mr. Raybold then went into the theater and brought him out a letter that was there for him. He sat down on the steps and commenced reading it. This was about 12 o'clock. He stayed there perhaps half an hour. I went into the office, and when I came out again he was gone. . . .

"There were several around Booth, talking to him. Mr. Gifford was there; Mr. Evans, an actor, and Mr. Grillet, I remember, were there at the time.

"The President's visit to the theater that evening could not have been known until 12 o'clock, unless it was made known by some one from the Executive Mansion. It was published in the *Evening Star,* but not in the morning papers."

James R. Ford:

"At the time of the assassination, I was business manager of Ford's Theater. I was first apprised of the President's intended visit to the theater on Friday morning, at half-past 10 o'clock. A young man, a messenger from the White House, came and engaged the box. The President had been previously invited to the theater that night, and I had no knowledge of his intention to visit the theater until the reception of that message. I saw John Wilkes Booth about half-past 12, two hours after I received this information. I saw him as I was coming from the Treasury Building, on the corner of Tenth and E streets. I was going up E street, toward Eleventh street; he was coming from the direction of the theater."

James J. Gifford, stage carpenter, Ford's Theater:

"I saw J. Wilkes Booth, about half-past 11 or 12 o'clock on the fourteenth, pass the stage entrance and go to the front door. He bowed to me, but we had no conversation."

Louis J. Carland, costumer at Ford's Theater, testified on trial of John A. Surratt that he knew "John Wilkes Booth quite well and had seen him three times April 14, 1865; the first time a little after 12 but before 1 o'clock in front of the theater, the second time between 5 and 6 p. m., the third time still later than this."

Sometime during the afternoon Booth bored a hole in the door of the Presidential box and secured a bar for the passageway door leading from the dress circle to the box.

Louis J. Weichmann, a boarder at the city home of Mary Surratt, the woman whom the government executed in connection with the assassination, testified that he hired a buggy at Howard's Livery Stable about 2:30 on April 14 and drove Mrs. Surratt to Surrattville (ten miles distance) arriving there about 4:30. Just before leaving the city he saw Booth in the parlor with Mrs. Surratt. Anna E. Surratt, in defense of her mother, testified that John Wilkes Booth was at their Washington House Friday, the fourteenth, and that her mother was preparing to go to Surrattville and that the carriage was at the door; that Booth only stayed a very few minutes.

James W. Pumphry:

"I reside in Washington City, and keep a livery stable. I was acquainted with J. Wilkes Booth. He came to my stable about 12 o'clock of the fourteenth of April last, and engaged a saddle-horse, which he said he wanted about 4 or half-past 4 that day. He had been in the habit of riding a sorrel horse, and he came to get it, but that horse was engaged, and he had in its place a small bay mare, about fourteen or fourteen and a half hands high. I have never seen the mare since."

Thomas J. Raybold, an employe of Ford's Theater, Mary Jane Anderson, who lived back of the theater, James R. Ferguson, keeper of a restaurant adjoining the theater, and others testified that they saw Booth at the theater that afternoon.

Where Shylock Stacks Golden Hay

How Germany's "Financial Managers" Have Worked While Sun Shone

By WALTER M. WOLFF

BERLIN—

WITH the reports of the recent Barmat Brothers and Kutisker exposures and the Holzman affair in Germany, the Castiglioni case in Vienna, and a host of other remarkable disclosures in which ernment officials and bankers of renown were cated, the eyes of the world have been opened very to the surprising influence of the Jew in the immediate affairs of Central Europe.

To say the least, the vast and elaborate Semitic financial structure in Germany has suffered a grave shake-up which is certain to develop into very serious complications and unpleasantness if further corruption is permitted to see the light. That corruption actually exists is now far beyond the pale of doubt. What Julius and Salomon Barmat, Jacob Michael, and other Jews have done to shake the confidence of the public in German financial methods may be the signal or warning that other even greater exposures are in store.

In an article published in THE DEARBORN INDEPENDENT, in the issue of January 17, the American people were introduced to the true "force major" in Germany today—the German Jew. The latter's impulsions upon the economic, political, and even the social life of the German Republic was discussed and it was learned that the extent of his multifarious grip upon the very destiny of Germany itself was almost incredible. Though but a small percentage of the population, yet everywhere there was the Jew. Scarcely an important German organization or institution existed, it was found, which did not have a Semitic influence within it or behind it. There was, furthermore, no avenue of escape from the Jew. The activities of the German people were so snugly and tightly made fast, we observed, that even Prometheus chained to his rock could not have felt more uncomfortable. We likewise perceived that the German Jew is not only the shrewd business man, the astute banker, and the invincible money lender. He is vastly more than all of these; *he is German finance itself* or the great bulk of it, for *there is no such thing as a "German" banker in the strict sense.*

The Average German a Good Banker

There are, to be sure, Germans and non-Jews engaged in the profession of lending, borrowing, and issuing money in all parts of Germany today, but the amount of real influence which these men exert upon the national finances is so small as to become almost negligible. The average German is notoriously a poor banker himself, and there are living at the present time very few truly prominent *German* bankers in Germany. We could name all the outstanding figures grouped under the last-mentioned category on the ten fingers of our hands. But what, in the meantime, can be said of the Jew? What of the alien race within the German borders? Without the slightest difficulty one could fill many pages of a good-sized tome in recording the names of Jewish families which have for centuries been the apex, the *"sine qua non,"* in the monetary affairs of Germany. Early he came, found fertile fields and fickle minds, and he has conquered all obstacles to complete economic domination. As "financial manager" of Germany today, the German (International) Jew has no competition whatsoever.

There is a young Jew in Germany at the present writing whose name only yesterday was practically unknown and his praises were unsung. Today he wears the shoes of Hugo Stinnes. This man is Jacob Michael, known as the present "King of the Berlin Stock Market" and one of the keenest of the new school of Jewish money lenders in all Europe, if not in all the world. But it is not so much of special interest to know Jacob Michael personally as it is to consider his remarkable methods in the manipulation of the German finances, and particularly the system—of which he is the criterion—by which the German Jews have loaned and borrowed huge sums of money at their own rates of interest. It is our purpose in this article to explain the methods and principles whereby Jewish hands juggle the German finances at the expense of the masses of the German people. Evidences of the manipulation of the people's money have, as we have previously noted, leaked out and now lie shamefully exposed in open view. Heads of old established banking institutions and industrial enterprises have fallen under the spell of Jacob Michael and his colleagues, among whom were the International Barmats and Iwan Kutisker. The Minister of the German Postal Administration, who immediately resigned, was sorely involved in the big mess, and there is a long list of guilty names yet to be recorded which may eventually take toll from every station of life in Germany—from the office boy to the Reich's president himself.

People's Money Shamefully Manipulated

Jacob Michael is a man scarcely thirty years of age, and his remarkable rise has been due largely to the late abnormal conditions and circumstances existing in Germany, but also to his own politic foresight which is that of a man more than twice his years. Michael also owes much of his success to a former colleague, Hugo Herzfeld, the notorious stock broker, now deceased. In this connection it might be said of Hugo Herzfeld that he was one of the very smartest of the German Jews for a time, and his name was, like Michael's today, heralded in every large banking house on the Continent. Herzfeld was a master of psychology and he made it his hobby to buy up the shares of some one of the leading German industrial corporations, forcing a demand for his newly acquired stock, and then selling out his holdings at a huge profit to another speculator. Herzfeld bought, for example, the majority of stock in the well-known Bochumer Guss-Stahl Gesellschaft, Bochum, one of the largest of the famous Ruhr enterprises, and then sold the entire lot to Hugo Stinnes who in turn annexed the concern to his other vast holdings in the Rhineland. But Herzfeld, like Otto Markiewicz and a of other Jewish financial wizards, could not long endure the mad grind and whirl with Mammon, and he died in the best years of his life while on a hurried vacation trip to Italy.

While Herzfeld was purely an ace on the Berlin stock bourse, Jacob Michael has not centered his activities to one avenue only. Michael's greatest rôle is that of loan shark, and due to his active participation in the German inflation swindle his vast fortune—estimated to be more than one hundred and fifty million gold marks—has been acquired much more quickly than Herzfeld's. The wealth amassed by the keenest of the American financiers is easily eclipsed and seems unimportant when placed alongside the pelf of this Jewish marvel. But Germany can boast of several Semites who are or were well on the golden trail blazed by the illustrious Michael, whose name less than twenty months ago was hard to find in the roster of German-Jewish financiers located in Germany.

What Jacob Michael does not own or control in Germany today, it might be said, isn't worth owning or controlling. His influence is manifested in almost every important industry in the country, chief among these being the chemical, textile, and metals industries. In the critical days of 1922 and 1923 when all Germany excitedly fled from the paper mark, to stave off insolvency, Jacob Michael and other German Jews were quick to take advantage of the situation by following Herzfeld's example in buying up large parcels of stock of German corporations whose financial embarrassment had driven them to the wall. These groups of concerns, most of them formerly German owned or controlled, are now known as "Konzernen," the Michael-Konzern, of course, being the greatest and most influential of all.

But how did Michael come into possession of the original capital with which to finance his conquest of German business? We must not lose sight of the fact that it was during the late months of the critical year 1923, while all Germany chafed and fevered under the excitement brought on by the hourly depreciation of the medium of exchange, that Jacob Michael and many score of his associates took scandalous advantage of Germany's pecuniary plight, and laid the foundations for fabled wealth almost within the bat of an eye.

Trillions of Marks for a Dollar

In previous articles which have likewise appeared in THE DEARBORN INDEPENDENT on the subject of the unparalleled German inflation fraud, we observed that wealth came almost exclusively to the privileged class—the bankers, politicians, and industrialists who were allowed to convert their paper profits into stable foreign currencies, an act which was denied under penalty to the masses of the people. Furthermore, the artful business men of the country, Jews and Gentiles alike, invested their huge inflation profits in new factories, canals, ships, villas, and what not, at very small cost, indeed, due to the cheapness of German labor which received ever-depreciating paper marks to the very end.

But Jacob Michael went a step farther than most of the parasites engaged in the wholesale exploitation of the wealth and resources of Germany. He worked the game from both ends. While the rest of the world was frantically at work dispossessing itself forever of the doomed, dying, apparently worthless paper marks, Michael gathered together all his holdings of German stocks and foreign exchange, and forthwith proceeded to buy up all the "worthless" paper marks on which he could lay hands. Michael knew that whatever goes up must come down sooner or later, and to all appearances in November, 1923, the end was in sight. Further depreciation of the mark now had become useless; no one would any longer accept the trillions of so-called bank notes, and revolution was imminent throughout the country. The people were sick of inflation and starvation, and they demanded an immediate stop to the farce. And so it actually happened at this particular moment that the downward rush of the currency suddenly came to a halt. Overnight, almost, the greatest finance manipulation of all time had come to a close with a bang. Bottom, apparently, had been reached and to go farther was impossible. And now this selfsame Jacob Michael found himself in possession of quadrillions of paper marks which only yesterday nobody would accept as a gift. He had staked all on the final stabilization of the German mark at *four trillion, two hundred billion* paper marks to the dollar—and won! Whether, now, Jacob Michael had been previously tipped off by certain German Government officials or Reichsbank directors regarding the precise period chosen for a definite stabilization, would be very difficult indeed to prove. However, we may be reasonably certain that Jacob Michael and other prominent Jewish bankers sufficiently informed themselves in time to know just what tomorrow's weather would be.

It was even possible to obtain, for a time, as high as eight or ten trillion marks for one American dollar because most Germans were decidedly skeptical that an actual stabilization which would be permanent had been effected. But it was not long before the German business men began to regain confidence in the mark, and to believe that the government now actually meant business. Consequently, the mark gradually receded back to the convenient level of four trillion, two hundred billion marks to the dollar. Jacob Michael, with his keen acumen, or whatever it was, had sensed the true situation and he had become the undisputed world's largest holder of German paper marks.

Also, soon after the final constancy of the German monetary unit had been re-established, German trade and industry began to rally from the effects of the inflation. Prices at once soared far above the world market level in Germany as a result of the reaction and return to actual, basic values. Germany soon realized that only yesterday she had been paper rich but gold poor. Money which had flooded the country before, now became extremely scarce. The Reichsbank presses were not able to print paper marks in trillion-mark denominations fast enough, and to check further inflation of the currency it had to limit its output of notes to the point of bare necessities. The German people awoke to the terrible realization that in actual dollars and cents they possessed little or nothing, monetarily speaking. But it was not so with Jacob Michael and his consorts. These individuals had begun to prepare for the harvest.

Let us draw, for a moment, a picture of the situation in Germany at the beginning of the year 1924. Business crippled and almost at a standstill, but struggling to continue. The people penniless, or with paper marks still in their possession, a trillion of which had now become the equivalent to *one* gold mark (23.8 cents). Money and credit as scarce as victuals in Old Mother Hubbard's cupboard, but the demand for them increasing daily. Jacob Michael and the watchfully waiting Jewish money lenders tarrying "just outside" to supply the hungry mob with the sweetest of soothing sirups. With this rough sketch before us, what happened?

Shylocks Were Stacking Golden Hay

With interest rates on the Berlin exchange amounting to not less than *twenty per cent per diem* for exceedingly scarce money, it became possible for those pecuniarily well-situated Semites, who knew what was coming beforehand, to double and triple their original holdings within a very few days. Michael, of course, during this critical period in Germany's financial history, was the chief money lender in the country, and he was able to "salt" away weekly many millions of real gold marks as interest profit. During the greater part of the year 1924 the extreme money stringency continued unabated, and the German Shylocks succeeded in stacking piles and piles of golden hay while the sun shone.

But Jacob Michael, although very shrewd in every sense of the term, is yet due for a deal of worry; his troubles have begun in earnest. Apparently, the inside ring of politicians and bankers and diverse associates who undoubtedly had something to do with the touching off of Michael and his cohorts at the psychological moment—or was it vice versa?—overdid the whole thing, and finally the pot boiled over. Michael has now been accused of having perpetrated the greatest case of flagrant usury and fraud ever exposed in Europe. His contemporaries have likewise been indicted in connection with the embezzlement and misappropriation of the funds of the old "Prussian Seehandlung" or "Staatsbank." While there has been considerable agitation waged in the Jewish-controlled German press in defense of Michael, it seems that "little Jake" has gone to Switzerland presumably on an extended vacation, but there are grave suspicions that he has but chosen a safe retreat whence he can observe favorably which way the wind blows in Berlin. It is typical of the International Jew that once he has been found out, he invariably plans a "vacation" or "retires" across the borders of the country which he has just exploited. Some of our German Jews "visited" the United States at critical periods in their affairs.

But to the details. Jacob Michael and the Barmats were connected with several of the prominent banking houses in Germany, and both had intimate relations with German state and municipal financial institutions as well. Michael is said to have rescued in the nick of time several provincial banks from liquidation by loaning them funds at fabulous rates of interest. To be sure, the firms which fell into Michael's lair ultimately repaid their obligations, but at what a price! For a long time, it seems, Jacob Michael was veritably the Czar of all Germany and was able to exercise power of life and death over the purse strings of the less fortunate. A few striking examples of Michael's methods are discussed herewith.

Drew Interest at 4,800 Per Annum

Between the nineteenth and twenty-ninth of November, 1923, Jacob Michael loaned to a certain Berlin firm, against triple security, a sum of money at the rate of *thirteen per cent a day* interest, or 4,800 per cent per annum! To a certain German bank in Berlin Michael loaned for a period of eight days, after the paper mark had been definitely stabilized, the sum of 860,000 trillion paper marks, for which he demanded and received by way of interest 203,350 trillion marks. (One trillion paper marks =One Rentenmark, Reichsmark, or gold mark.) The said bank, of course, found tremendous difficulty paying back the loan, and its prestige was not a little affected. Another German commercial enterprise was lured into Michael's clutches when it borrowed on the seventeenth day of November, 1923, the sum of ten quadrillion paper marks and paid for the privilege at the rate of *twenty-three per cent per diem!* Call money at the same time in Berlin averaged only 8½ per cent a day. But the strange and sinister part of this business was that German merchants were able to obtain only very sparing amounts of money on the Berlin market. The big, worth-while sums which were so sorely needed to refinance stagnant trade pursuits, it appears, were loaned exclusively to the Jews at the low prevailing rate of

The Humor of Will Rogers

Ex-Cowboy Entertainer, Who Chews Gum, Throws Rope, and Comments on Topics of the Day

BY D. JAY CULVER

WHO is the worst bore in the world? Probably you have already named your candidate but Will Rogers nominates the irrepressible story-teller who always has "a new one" up his sleeve. "Here's a dandy. Stop me if you've heard it. . . ." That's the way they invariably begin.

"I am proud of the fact that I have never told a typical stage joke," Will Rogers boasted to the writer recently.

This may sound rather paradoxical coming, as it does, from the man who is the leading humorist in America today but it isn't quite so strange when he explains what he means by a stage joke.

"Stories about Scotchmen, traveling salesmen, stage-door Johnnies and the rest of the stock characters are on my blacklist. I tell nothing but 'gags.' They're short comments on the day's news. I read the evening papers and then just tell about what I find in them. I get some of my best stuff from the editorial pages. Speaking of the other kind of jokes, I suppose I've been told 9,000,000 and I've forgotten them all. I bet I couldn't remember one if you locked me in a room for forty-eight hours. Every time I see a story-teller coming I try to sneak away and if I can't make it, I shut both ears. You can't stop 'em once they get the habit of repeating stories. That's why they're such pests. It gets me specially riled when they hint that I can twist their jokes around and use 'em in my act in the 'Ziegfeld Follies.' If I ever told stuff like that, maybe they might be excused but I never have and I never intend to. I'd go back to my ranch out in Oklahoma first."

Night after night people flock to the "Follies," largely to see and hear Will Rogers. The girls have made this show a national institution but at present, this rough-and-ready ex-cowboy is the principal drawing card.

He occupies a peculiar position in the amusement world. Twenty years ago, he was just a plain, ordinary cow-puncher who knew how to make a rope obey his every command. This wasn't so unusual in Oklahoma, though. Today, he is one of the few original comedians on the stage, a keen and recognized student of political affairs, and the writer of a weekly article, satirical but sane, on current topics. He is known from coast to coast and he knows everybody worth knowing. Last summer he hobnobbed with the Prince of Wales when he was in this country, played polo with H. R. H. and told him his best gags. He knows the leaders in politics and in the business world. His income is one of the largest earned by a member of the theatrical profession. And yet, he is the same big-hearted, generous cowboy who started out a good many years ago to see the world. But more of that later.

WILL ROGERS.

No luncheon is complete without Will Rogers as the after-dinner speaker. No matter what the occasion is, he can find the appropriate thing to say and he says it without hemming or hawing. He talks with the same nonchalance before bankers, ad-getters, scientists, and big business men. Apparently quite casually, he pricks the toy balloons of their conceit and "kids" them about their pet foibles and weaknesses.

It seems casual enough but if one were to look into the matter, he would find that this ex-cowboy, who never got any farther in school than McGuffey's Fourth Reader, had made a pretty thorough study of the profession or business to which his hearers belonged. And what pleases them is that he has the courage to come out and say things that they would hear from no other man. He doesn't hurt their feelings. They laugh at themselves and seem powerless to resist his line of chatter.

"How can you tread on their toes without hurting them?" we asked.

"Well, you see it's like this. I never tell 'em anything that isn't founded on fact. No matter how much I may exaggerate, there must be an element of truth in everything I say. Another thing. It's a lot in the way I say it. I don't jump on them and bawl them out the way a lot of public speakers do. I just sort of kid 'em along—as if I knew all their secrets and there wasn't any use for 'em to try to keep anything back on me. I've always found that big men appreciate jokes on themselves. I never need to worry about their becoming offended. It's the little fellow who is just beginning to get up in the world who is easily upset.

"I recall when President Roosevelt was in the White House and I was a cub performer, I took several flings at Teddy. Later when I was invited to the White House, I remarked on meeting Roosevelt:

"'Well, I hope you are not going to put me in jail.'

"Roosevelt laughed heartily and said, 'Will—I'm going to call you Will—don't be afraid you will hurt my feelings. Whenever you can use my name to advantage go the limit.'"

"Will Rogers' Illiterate Digest," a recently published collection, in book form, of his weekly articles for the newspapers, contains many fine things, but nothing better than the chapter entitled, "Wilson Could Laugh at a Joke on Himself."

In this brief chapter, Will Rogers presents a picture of the late President Wilson that is new to most readers. We will endeavor to pick out a few passages from it to give an idea of what it is like.

In describing the first time he appeared before the late President, he writes:

"I was on the bill late, and as the show went along I would walk out of the stage door and out on the street and try to kill time and nervousness until it was time to dress and go on. I had never told jokes even to a President, much less about one, especially to his face. Well, I am not kidding you when I tell you that I was scared to death. . . .

"But here I was, nothing but a very ordinary Oklahoma cow-puncher who had learned to spin a rope a little and who had learned to read the daily papers a little, going out before the Aristocracy of Baltimore, and the President of the United States, and kid about some of the policies with which he was shaping the destinies of nations. . . .

"Fortunately I kept a copy of the act I used that night. My first remark was, 'I am kinder nervous here tonight.' It was so obvious everybody laughed. Then I tried several gags about the Mexican situation and our lack of preparedness. Then I first pulled the one which I am proud to say he afterward repeated to various friends as the best one told on him during the war. I said, 'President Wilson is getting along fine now to what he was a few months ago. Do you realize, People, that at one time in our negotiations with Germany that he was 5 notes behind.'

"How he did laugh at that! Well, due to him being a good fellow and setting a real example, I had the proudest and most successful night I ever had on the stage. He came back stage at intermission and chatted and shook hands with all.

"When he passed on, the world lost a friend. The Theater lost its greatest supporter. And I lost the most distinguished Person who ever laughed at my little nonsensical jokes."

In another part of the same book, Will Rogers remarks: "A comedian is not supposed to be serious nor to know much. As long as he is silly enough to get laughs, why, people let it go at that. But I claim you have to have a serious streak in you or you can't see the funny side in the other fellow." Nobody needs to have it explained after reading his tribute to President Wilson that Rogers has a serious streak himself.

At the "Ziegfeld Follies," he frequently recognizes prominent persons in the audience. He makes them stand up while he introduces them to the crowd. If they don't get up he threatens to rope them and get their white shirt fronts soiled. Needless to say they comply with alacrity. No other comedian would dare take so many liberties with his audiences. But he not only gets them up and pokes fun at them while they are standing there but he makes them like it. Anybody who can do that is a genius.

Not long ago, he met his match. He observed Chauncey Depew, the grand old man of American humor, now in his ninety-first year, in the audience and he called upon him for a speech. Mr. Depew rose obligingly and remarked, "I have been entertaining people for seventy-one years now and I have never had to use a rope!" The audience burst into laughter.

The next day, at the matinée performance, Rogers told about his experience and wound up with this frank admission, "Well, he sure hung one on me that time. If he ever comes back I won't give him a chance to speak."

On another occasion, he spied Mayor Hylan in the theater and made him rise. Then while he was standing

Will Rogers in "The Headless Horseman."

Fallacies of Finance

The Gullibility of America, and Something of Two Famous "Bubbles"

By GEORGE [illegible]RRETT DE MORE

THE history of American speculation has never been written. To trace its development we have only fragments from the various financial periodicals and anecdotes of such characters as Johnny Miller and Charlie Howard, William M. Sheridan and the Burr Brothers in the field of swindle and Jacob Little, Daniel Drew and James R. Keane in the realm of stock speculation.

The course is marked with such mileposts as the carpetbaggers of the post Civil War period, the Louisiana Lottery, the flotation of the United States Steel and Amalgamated Copper shares, the Northern Pacific panic and the period of frenzied finance and credit inflation following the World War.

There is no record of the billions of dollars honestly earned by thousands of workers and taken by the financial sharpers who follow upon the crest of each wave of prosperity—financial parasites who trade upon the ignorance of the unsophisticated and the human weakness of hoping to gain great wealth with the expenditure of least effort.

Working in cliques unmolested by law until Kansas led in 1911 with a statute regulating the sale of securities; since then defying blue-sky legislation through the assurances of crafty lawyers that such laws are unconstitutional, the practitioners of low finance have eaten the country like a plague of locusts, eclipsing all former records of the greed and graft of early high finance.

From 1903 to 1911—according to a tabulation by the *Financial World* in the latter year—unscrupulous promoters took a toll of more than a billion dollars, divided between 119 mining companies, capitalized at $528,000,000; forty-one oil companies, capitalized at $83,500,000; eighty miscellaneous companies with a capitalization of $448,000,000.

As this tabulation contains the operations of the larger promoters only, it is certain the total was $500,000,000 greater.

Today these same systems, larger grown, reap a harvest of between $500,000,000 and $1,000,000,000 annually in the United States.

Gathering around them impressionable young men, the apostles of "get-rich-quick" have formed organizations which are in fact schools in the art of swindle. Graduates have scattered to the far corners of the nation until today for every promoter of the magnitude of George Graham Rice, William M. Sheridan, L. E. Cooke, or Leroy Sargent we have a thousand operating on a smaller scale.

With the ingenuity of a Lorenzo Tontine, the Neapolitan who originated the financial scheme bearing his name, the unscrupulous promoter in America has devised a variety of frauds calculated to circumscribe the law, remove the suspicion of the public and rob the purse of the unfortunate led away by golden promises of easy wealth.

Some of these frauds are as simple as the shell game, as old as the lie; others as complicated as the fourth dimension, devised on the spur of the moment to capitalize the popularity of a new instrument such as the radio.

How are all these things possible? Are the American people naturally gullible? Is the delusion of sudden wealth through the purchase of any kind of stock peculiar to America?

The Oriental is shrewd, the Frenchman is thrifty, and the Englishman is careful and even suspicious in financial matters; the Scotch are traditionally "canny." Stories of gigantic swindles in the countries of Europe are most infrequent. None of the barely plausible schemes which year in and year out net millions in America would receive a moment's notice among foreign people. Why then the Americans?

With this in mind I discussed the question with a psychologist.

"The ease with which the average American is swindled through fake stock schemes is due to three causes," was his answer.

"First, we have a national trait of optimism, born of remarkable progress in a comparatively new land, which is nourished by the examples of individual success in the industrial and financial worlds.

"Second, our immense national resources have been transformed into wealth through the medium of the stock company, which, though entailing the evils of luxury and ease for a certain class at the expense of the majority, in many instances creating the dangerous condition of absentee ownership and centering the balance of power in the hands of a financial oligarchy dominated by a few individuals—was the only medium at hand to finance the marvelous industrial state America has become.

"The third cause is one which is found in every country in the world at some period or other when the mind of the people becomes obsessed with a single idea to the exclusion of all else. When a country is engaged in trade expansion and the cycles of prosperity recur at short intervals, each wave washing the sands of wealth higher and higher, the fixed idea becomes the making of money. An industrial expansion like ours which bids fair to establish American prestige and power in every habitable spot in the world has ever been paralleled with the evils of excessive speculation, through which the financier deludes the man carrying the brunt of the burden with his prospectus of amazing wealth to be won at the flip of a coin. Just take a look at history."

The records of the past yield a wealth of material regarding the action of a people obsessed with a fixed idea, particularly when that idea is that the royal road to wealth is speculation.

The period of the Tulip Mania in Holland was preceded in Europe by that curious spectacle of a continent in the grip of atavistic impulse, giving rise to the Crusades. Later the delusion of the Philosopher's Stone caused untold suffering.

It is probable there were financial swindles and instances of blind speculation before Holland was deluded into creating an artificial wealth, even in Grecian and Egyptian times. Since man has first found a moment's peace from relentless nature by assuring himself a food supply, he has been obsessed by the idea of accumulation and possession. Just as in the earliest times it was for the greater number of flint axes and spears that one man competed with another, so today it is dollars, the most popular unit of wealth. It was this instinct which gave rise to the collecting of tulip bulbs in Holland early in the seventeenth century.

The stage was set for just such an exhibition of frenzied speculation as occurred.

The Spanish Jew—the aristocrat of the race, endowed with great artistic sense and financial ability, who thrived in England and Germany, coming thence to America to bid for control of both the artistic and mercantile worlds—had been driven out of Spain and found refuge in Holland. He taught the Dutch how to create an artificial wealth which soon made it the envy and wonder of its larger neighbors. The Netherlands became a country of daring traders and the wealth of the little land was pyramided higher and higher.

It was inevitable that a medium of speculation to suit the public fancy outside legitimate trade would be found. The tulip bulb became the fixed idea, the symbol of wealth, this lowly root becoming more desired than diamonds.

Contracts were made to deliver roots at a future date. The contracts were sold, resold and sold again, each transaction at a higher price, creating an artificial value.

Contracts for roots that were never grown, could never be grown, became an instrument of finance more prized than gold or silver, an instance proving that the value of precious metals is based solely on man's belief in their worth.

At the peak of speculation one root sold for 2,500 florins in goods. In this merchandise was butter valued at eight and one-half florins a pound, thus putting a valuation on this single tulip bulb of 21,250 pounds of butter.

The mania spread to other countries. The economic balance of the continent was upset, all by this delusion that tulip bulbs were of great value and would continue to increase in value year after year.

Suddenly, as with all similar speculations, in 1639 the bubble burst, leaving in its wake impoverished families, suicides, bankruptcies, and a disorganization of trade which worked hardship for a decade.

Holland paid a terrific price to learn the evils of blind speculation, but the lesson was never forgotten.

The result of the Tulip Mania was a reaction to conservative investment which continues to this day.

The Hollander has had instilled in him the knowledge that misplaced confidence in a financial fallacy will prove costly and he has been content with a legitimate return on an investment backed by the highest security.

Under this policy, which became a national tradition, the country built up its wealth on a firm foundation, until when the treasure store of the New World was opened up, the Holland Dutch contributed largely to the financing of railroads in America, taking in return a mortgage on the property. It was not until the World War that the United States, wasting a large percentage of its wealth in speculation as foolish as the Tulip Mania, completed paying its debt to the capitalists of Europe.

The Louisiana Lottery awakened the American people to the evils of this form of gambling and the lottery has been stamped out never to return. But no such example has ever been made of stock speculation in companies which are within the law but nevertheless pure frauds.

England and France learned lessons in the Mississippi and South Sea bubbles, which subsequently bred a conservative policy of investment in these peoples.

In many respects the frenzied speculation at the times of the bubbles in these countries parallels the speculation in mining, motor, oil, radio, aircraft, and miscellaneous schemes of the last decade in the United States. But a few hundred wild ventures placed in operation in England between 1711 and 1721, taking a toll of 3,000,000 pounds sterling, look very slight when compared with the thousands of fake companies formed in the United States the last ten years and capitalized at approximately $5,000,000,000.

Hundreds of these companies are known and many of them are doing business at the present time. An incredibly small number, less than 2 per cent of the fakers, have paid the penalty of their fraud by serving prison sentences.

The financial swindler thrived in England until driven out and the English Companies Act passed; a piece of legislation which makes impossible such schemes as are practiced in the United States today. He will thrive in America until the hand of public opinion is raised against him and adequate national laws passed. Constant publicity is the public's only defense against the subtle schemes, constantly changing in practice.

McGuffey's Maxims

Little Tales of Conduct From the Famous School Reader of the Last Generation

THE WOLF

1. A boy was once taking care of some sheep not far from a forest. Near by, was a village, and he was told to call for help, if there was any danger.

2. One day, in order to have some fun, he cried out with all his might, "The wolf is coming! the wolf is coming!"

3. The men came running with clubs and axes to destroy the wolf. As they saw nothing, they went home again, and left John laughing in his sleeve.

4. As he had had so much fun this time, John cried out again, the next day, "The wolf! the wolf!"

5. The men came again, but not so many as before. They saw no trace of the wolf; so they shook their heads and went back.

6. On the third day, the wolf came in earnest. John cried in dismay, "Help! help! the wolf! the wolf!" But not a single man came to help him.

7. The wolf broke into the flock, and killed a great many sheep. Among them was a beautiful lamb, which was John's, and which he loved very much.

8. The truth itself is not believed,
From one who often has deceived.

Caro D. Coombs on Budgets

By DIRK P. DE YOUNG

"WOMEN do not like to keep complicated budgets," says Caro D. Coombs, secretary of the Division of Remedial Loans of the Russell Sage Foundation, New York City.

Miss Coombs is quite an authority on thrift and thriftlessness. She prepared a model budget for Uncle Sam during the war, after much personal investigation among women, while for several years she has had charge of credit union organization in the Empire State, a system of co-operative banking for persons of limited means.

Even such a simple matter as keeping a check book, in accord with the statements rendered by the bank, is a great task for many of her sex, according to her, to say nothing of the bookkeeping involved in most of the budget-book schemes. Most housekeepers like the idea of accounts, but they flounder when they get too deep into the science of budgeteering. Besides, they don't generally like to follow a hard and fast rule of posting items in their books. They want to do it a little different, so to speak, than the lady across the street, just like a woman wants her hat or her dress to express some individualism alongside the apparel of her sister.

Miss Coombs consequently encourages budget-keeping by making the books as simple as possible. In her house-to-house canvass to get first-hand facts on the subject, she discovered that most people hated the average account book with its lines and spaces. The women she talked to preferred a plain notebook, with few rulings in which to get tangled up, rather than the complicated budget books all ruled up in red and blue compartments with sundry heads and subheads. Moreover, it was also learned in those visits that few women like to balance their cash every day. As a result she thinks it best to encourage budget-keeping by the simplest possible set of books, leaving much to the discretion of each particular household. According to her experience—several years of promoting thrift among all classes of people—we enter into the idea of thrift and systematic spending with a better spirit if we are allowed to express great individuality in the process.

People do not like to be told what and how to do things too much, Miss Coombs explained. Nearly everybody likes a good sermon—from the pulpit—but preachments on how to do everything get to be stale discourse. Her idea is to get women interested in keeping accounts of some sort, no matter how crude, and thrift will follow.

Mr. Ford's Page

THOSE who take a delight in the glories of nature are never really poor. Much of the joy of life is missed by those who pursue their way blindly through the world taking no heed of those things which ought to delight the eye and elevate the mind.

It is said that no other people on earth are so sensitive to the charm of a landscape as the people of Korea. "They will travel miles on foot to climb a pass or see a view." These Koreans have got hold of the right end of things. There is nothing more inspiring than the beauties of nature, nothing more refreshing to the mind than the infinite variety of form and color and atmosphere that is to be found in the prospect of mountain and lake and woodland and field.

There is no country in the world that is richer in the range and variety of its natural features than the United States. At all seasons of the year and in all parts of the country there is something that is worth seeing, something that even the dullest soul may admire. There are certain parts of the world where restrictions are imposed on those who would climb mountains or explore the woodlands, but in this country the most gorgeous gifts that nature can bestow are there for the seeking. One who possesses these gifts and appreciates them can never be poor, on the contrary he is in possession of a heritage that is richer than any other that the world can bestow.

Let us pause for a moment and see what this means. An expensive house may be built with the finest materials that can be procured, and endowed with all the features that the skill of the architect can devise, but what is it that gives the real beauty to the structure? Is it not its setting, its environment? What would any home be without the background which nature supplies? A group of shrubs here, a plot of flowers there, a shade tree where its beauty appears to the best advantage and where its utility may not be lost.

Even in the crowded cities where utility has played havoc with trees that flourish and flowers that grow, the ugliness of the surroundings will be redeemed by a tiny patch of green grass or a solitary shrub.

Not so long ago one could scarcely pass a cottage or a humble dwelling of any sort but there would be a fuchsia bush with its rich purple tassels, or a box or tub filled with scarlet geraniums or blue lobelia. This custom is by no means dead, but generally speaking there does not seem to be the same interest in the garden plot that there used to be.

But there is no finer garden, no more magnificent park than that which Nature herself provides. The means of cheap and rapid transit now available make it easy for the city dweller to reach those scenes. But one wonders whether those so readily brought in touch with Nature's haunts fully appreciate her delights. If they do not they are missing a rare opportunity. Let them think of the Koreans who will travel "miles on foot to climb a pass or see a view."

The man who takes pleasure in the works of the Creator is never at a loss. His possessions are not circumscribed by any man-made boundary. There is no more refining or enlightening influence than that which is derived from intimate contact with things not made by man and which man with all his skill can only imitate.

The copying of ideas from nature is the basis of all decorative art. It is said that the fabric known as "shot silk" was suggested to the designer by the variety and beauty of coloring in the glow of a sunset sky. The reflection of the clouds in the lowly bosom of a lake may inspire the highest ideas. There is scarcely an aspect of nature that has not suggested some thought sufficient to lift mankind out of the rut of everyday sterility and set us on a higher intellectual level.

But perhaps the greatest delight of all is the feeling that no matter how lowly one's position may be there is always the azure of the sky, the purple of the hills, and the russet and green of the woods and fields. There is the song of the birds and the music of wind and wave and waterfall.

The thought that all this is free to us, that no deed or legal process is required to make us the owners of it, and that in finding pleasure in it we are following one of the oldest and most refining instincts of mankind, is highly inspiring. To some the mountains may make the greatest appeal, to others the sea, to others the woods and fields, to others the rolling prairies.

Few realize how rich they are in the unrestricted enjoyment of all these things. The only one who is really poor is the prisoner pining in his cell for the fresh air and envying the sparrows that chirp in the prison yard.

There are not two days in the year when the pictures presented by Nature are exactly alike. Each season has its forms, its colorings, and its atmosphere. There are the browns and grays of winter, the delicate greens and purples of spring, the gorgeous tints of summer, and the russets, scarlets, and golds of autumn. A continuous and ever-changing mosaic is thus supplied. No artist has ever been able to duplicate these things; all that has been done has been to imitate; but even those feeble attempts to depict on paper or canvas or carve in stone those things which delight the eye are given places of honor in our drawing rooms and art galleries.

Take those sculptured masterpieces of nature which men travel many miles to see; the snow-clad mountain tops, the frowning cliffs, the subterranean caves with their fairyland of wonders, the infinite variety of contour and color that is to be found in the lonely canyon. There is not an hour, or not even a second, that those lights and colorings are not changing, that they are not passing from one phase of beauty to another.

To the enjoyment of these wonders of earth and sea and sky there is no limit. They are there for the seeking. Modern transportation has made it easy to reach all parts of the country.

Strange as it may seem, it is frequently those who have the grandest works of Nature at their doors who are blindest to their beauties and who are fondest of going off long distances in search of things that they might have been able to enjoy much closer at hand. It is but natural that people in inland towns, sometimes hundreds of miles from the sea coast, should wish to see the ocean and enjoy the opportunity of inhaling its bracing breezes. It is also to be expected that those who have been brought up within sound of the sea should long for those scenic wonders which lie for many miles inland. Of course, tastes in scenery differ as they do in almost everything else. Some love the rugged mountains, others the quiet, peaceful valleys.

That "distance lends enchantment to the view" may be a trite phrase, but it is a true one. The landscape always appears more beautiful when it is viewed through the haze of an autumn day, or in the mellow rays of a glowing sunset. That thing is always the most desirable which for the moment we cannot reach. This is why people are on many occasions impelled to look farther than there is any necessity. There are those who cannot see any good in that which is easy of access, and go in search of that which is difficult to attain.

A man may be possessed of all the material wealth of the universe, but if he lacks the faculty of enjoying the best gifts of the Creator, he is the poorest of the poor.

THERE is on this continent almost every variety of scene that the wide world can furnish. There are mountains which for majesty and grandeur cannot be equaled in any other country; stately rivers, magnificent lakes, boundless woods, mighty waterfalls. In spite of improved highways and cheaper transportation this vast heritage is not appreciated as it ought to be. We are always seeking for those things which are in the clouds, not for those that lie at our feet. It is not that which we hold in our hands or store away that makes up wealth, it is the faculty of fully appreciating and enjoying those things without which the world would be a vast sterile tract as devoid of beauty as the moon with its oceans of ashes and burnt-out craters, which nothing can redeem.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

War on Waste

THE United States Chamber of Commerce has proposed a war on waste which shall save to industry, hence to the people, ten millions of dollars annually through the elimination of useless cost in manufacture and distribution.

Recognition of an evil is the first step toward its abolition. Unless such recognition be more than merely the passing fad of the hour, the pet hobby of a small part of the membership of the organization, little is to be hoped for from the proposed drive for economy. If, however, it shall prove the determined effort of a strong civic body to rid itself of an incubus, the estimated saving will be found extremely conservative, and but a fraction in comparison with what may be accomplished by broadening the drive to include other fields.

Wastage in many lines is deliberately excused on the ground of the prodigality of Nature. Few blossoms come to fruitage, and the bountifulness of the harvest is trifling compared with that which would have followed the germination of every seed. When, as is often the case, it is possible to better the quality of the product of garden or orchard, we do not hesitate to prune and thin out the stand, be it tree or bush or vine. This is justifiable waste, but where production is governed by the whim of the faddist, there is an inevitable diversification which is bound to be an enormous loss due to discarded or unpopular style.

A maker of men's hats is said to have in stock 3,684 styles and colors to select from, yet a survey of his business shows 90 per cent to be confined to seven styles and ten colors. It is plain there is waste in supplying so many units.

In the finances of the nation can be found the greatest example of waste; yet in few discussions of the cost of useless things is it pointed out or even referred to specifically. Perhaps the Federal Reserve System is the most expensive of the useless machinery the people must maintain. For all that is claimed for it, there is no question of its failure as a business enterprise, as a protection to the nation in time of stress, and as a scientific advance in the banking business. An absolutely private body, its expense to the government exceeds that of any bureau in official life. Yet the stockholders in the Federal Reserve banks complain of inadequate returns—unjustly, it may be, but they complain—and the unreasonable restriction imposed by the governing board. The State banker who thus complains has no reason for doing so. He is not compelled to join the system, but the National banker has just cause, since he is conscripted and must be a member to retain his government charter.

The system itself lies like a parasitic tumor on the body politic. The Treasury itself could provide the reserve necessary, and the issue of currency could be based on national securities. The maintenance of a currency at gold par is impossible without government authority. Why, then, subsidize a group or class and give it power of taxation as well?

Another wastage is the numerous forms of the circulating medium. The Bureau of Engraving and Printing is ceaselessly producing new issues, none like the others, of the nine government styles in current notes or demand certificates of indebtedness. But one style for each denomination, and fewer denominations, would save to an aggregate hardly believable, besides restoring the principle of free banking under license and regulation, a saving beyond comprehension.

Matrimonial Agreement

BELIEFS as to the dissolubility or indissolubility of marriage differ between clergyman and clergyman, creed and creed, Church and State. Opinion concerning its worth and practicality varies even more widely. Suggestions for making it work are as plentiful as the sands of the sea, and no two are entirely alike.

Whatever the question asked regarding this interesting matter, there seems to be no unanimity whatever in the chorus of replies which every day claim space in the newspapers.

If only judges, clergymen and laymen in general might, with respect to harmony of view on this subject, follow the example of the daily press itself! What unity, what overwhelming oneness might then be discerned, where now is a veritable Babel of bickering and confusion!

"Do married men live longer than single men?" asks someone or other, we dare say, in some newspaper or other, on each of the three hundred odd days of the year.

"No," comes the prompt reply, "it only *seems* longer."

There are by actual count 2,856 variations of this sweet-smelling hardy perennial, but in no case does the conclusion fail to assay, in effect: Marriage is a Long Sentence.

In two inches of newspaper column, headed "In Brief," at the writer's elbow, we find:

"Husband: A man who serves five minutes as commander-in-chief and the rest of his life as a private.

"With waning of the honeymoon the misguided man discovers that the coming woman has arrived."

Two inches west of these pearls of thought—so carefully sifted out from among the less lusterful and set fittingly in that short, precious space—the eye beholds:

"After a man has been married a year he doesn't get brain fag from thinking of his wife when she is spending a few weeks in the country."

The manner in which the author of this gem has abjured commas and hastened breathlessly onward, that the conclusion might not find the flush of inspiration chilled, would give one to believe that the emission quoted contains some fresh and startling truth.

Reflection, however, and a careful re-reading of the piece, will bring one regretfully to the conclusion that the Creative Urge has here—by the strange fatality that rules all genius—run down the identical drain where once trickled the classic entitled, "My Wife's Gone to the Country."

Naturally, we refuse to join in the exultant refrain.

All this goes to show how tensely and indefatigably our newspapers strive to keep alive and active their faith in the tedium of marriage. Such insistent devotion applied, say, to the cause of administrative efficiency would lower our taxes at least 20 per cent within a very few years; but in the meantime it is possible that the victims of marriage might forget their plight.

That would never do.

Let marriage be for all time, or part time; let Federal employes multiply until there is nothing to divide; let institutions rise, fade, pass away. These are but "the fashions of this earth." As such, the press treats them unenthusiastically, holding them at arm's length.

The matrimonial wheeze, however, is eternal.

Telling the Truth

ANSWERING the Federal Council of Churches at its annual meeting, Robert E. Speer uttered the following striking words:

"The hardest thing in the world is to tell the truth: the desire to tell it is easy, but to get the facts, to estimate and interpret them properly is most difficult."

Commenting on this statement, the *American Friend* thinks Dr. Speer too optimistic in considering the desire easy. It says in substance: We may think we desire to tell the truth, but when thoroughly aroused for or against some movement or cause, however good, our zeal sometimes outruns our relish for hardpan facts.

The Quaker press generally may be praised for its close adherence to the teachings of the Master it professes to serve. Were the same thing to be said of all religious papers, it would end a great deal of the intolerance with which humanity is cursed.

The courage displayed in the confession should be a spur to self-examination. The commentator illustrates the difficulty of confining argument to truth, or rather the proneness to present only a part of the truth, carrying a lesson as to the wisdom of taking nothing for granted. So prevalent is prejudiced argument, that one owes it to himself to inquire into the merits of both sides.

Rack and Rope

THE days when every "civilized" country had its official torturer and lord high executioner are happily gone, but the age of the rack and rope has by no means died out. The subject of capital punishment is one which is receiving more and more attention these days. It has not only passed beyond the bounds of the village debating society, but it is seriously discussed by some of the leading men of all lands. It formed the subject of debate at a meeting of the Oxford University Union quite recently, and some interesting facts were disclosed by Commander Kenworthy, a member of parliament.

He said that in England murder was not the only crime for which death was the punishment. Sheep-stealing was still a capital crime in England, though it was not so in Scotland, and although there was more sheep-stealing in Scotland, that was possibly because of a greater liking for mutton. Hanging, drawing, and quartering was still in the penal code, and had been carried out within living memory, for treason, which consisted of criticizing the government of the day. Torture and flogging were also still possible under the penal code of England.

There are still some Americans who believe that the dungeons of the Tower of London are the scenes of terrible happenings in which the official torturer and his satellites "do their office" on poor victims whose cries and groans are heard at midnight in the precincts of the grim old fortress. The late W. S. Gilbert may be partly responsible for this, for, in his comic opera of "The Yeoman of the Guard," one of the lyrics informs us that:

> "The screw may twist and the rack may turn,
> And men may bleed and men may burn."

But such ghastly happenings are unheard of these days, and there is absolutely no chance of their ever being revived unless a Bolshevist regime gains the upper hand at Westminster and puts in force the methods by which Lenin and Trotsky brought the blessings of "freedom" to benighted Russia.

The supporters of the abolition of capital punishment at the Oxford debate maintained that it was not a deterrent to the taking of human life, and that in countries where it had been done away with there had not been any increase in the number of murders. Some American jurists have a different opinion, and point to the strict administration of British law as a reason for the comparative immunity of that country from serious crime. One of the stock arguments of the abolitionists is that "human life is sacred." It seems a pity that they cannot drive home this precept in the wolf-like minds of the thugs and gunmen. By doing so they would kill capital punishment much quicker than by any other method.

French Finance

THE French Minister of Finance recently spoke in a reassuring fashion of the French nation's ability to settle the French Government's outstanding debts. In the course of his speech he referred to these debts as "loans contracted in the defense of her (the French nation's) frontiers." And for a triumphant conclusion he inventoried the reserve wealth of the nation, in part, as: "The fertility of its soil, developed and improved by the labors of many centuries, its network of roads and railways; its rivers and streams, regulated and widened by the canals, its telegraphic and telephonic system, and all the equipment accumulated in its harbors and factories."

It is no desire to criticize adversely the French or the French Government that causes us to look askance at this optimistic oration. But it is difficult not to remember that during the years which have passed since the Armistice, the French Government has on occasion used its borrowed money to provide rather aggressive defense for frontiers not under its flag, separated from French boundaries by alien soil some hundreds of miles in extent. These frontiers, moreover, had been fixed and guaranteed by the signers of the Treaty of Versailles.

Of course, since this long-distance defense was provided for, the personnel of the French Government has changed. But the sanguine and ingenuous setting forth of the items listed above seems to indicate that the change has been *only* with respect to personnel.

This casting into the financial scales of the hard-won and fundamentally necessary improvements made possible by the rigorous thrift of the French people—of fertility and of facilities almost as basic under modern conditions as the soil itself—fails distinctly to inspire confidence in the economic wisdom of the present rulers of France.

When the ancestral acres are spoken of as though they were mobile capital, or its easily convertible equivalent, we are apt to be reminded of how that which the spendthrift father has not presumed to endanger represents only ready money to the indigent son.

The Telegraph's Eightieth Birthday

Many People Were Terrified at Morse's "Newfangled Contraption"

By VIOLET K. LIBBY

IN THESE days of radio and wireless, telephone and telegraph, few persons realize that it was only eighty years ago that electricity was first used to send messages. The new age of easy communication was inaugurated in a most modest way on April 1, 1845, when the first public telegraph office was opened, and it was a long time before the public would overcome its prejudice and make any practical use of it.

For several years previously scientists on both sides of the Atlantic had been experimenting with electricity—Benjamin Franklin was one of the first—and in 1827 a young man named Dyar put up on a Long Island race course a telegraph line which communicated signals by the discoloration produced by an electric current upon a piece of wet litmus paper. He was met by intense prejudice when he tried to introduce his idea into general use, and it was even rumored that he was in league with the devil. In fact, feeling against him and his invention ran so high that he went in fear of his life, and finally was forced to leave the country.

Professor Samuel Finley B. Morse, who devised the first practical scheme for sending messages over long distances, was a well-known historical painter, and the founder of the National Academy of Arts and Sciences, of which he was the first president. Although he knew practically nothing about electrical science, he was the first to see the possibilities for communication in the use of electricity and the electro magnetic experiments of Joseph Henry and others.

It happened that in 1832, Morse, who was on his way back from a trip to Europe, was present at a discussion on electricity among his fellow passengers on the packet *Sully*. Professor Charles T. Jackson, a well-known scientist of Boston, made the statement that a current would manifest itself at the distant end of a conducting wire instantaneously.

If this were so, thought Morse, why could not messages be communicated over long distances by the same means? The idea interested him so much that he spent the rest of the voyage speculating on the possibility of putting it into concrete form, and as soon as he landed he started to work to develop the code which bears his name, and the apparatus for transmitting it.

A rare old drawing of Broadway in 1845. The three-story houses on the left stand on part of the ground now covered by the immense building of the American Telephone and Telegraph Company.

Professor Leonard D. Gale, of New York University, helped him work out his experiments, but lack of funds proved a serious hindrance. Morse was so convinced of the possibilities of his plan that he gave up his painting and devoted all his time to the telegraph, with the result that his income was reduced to the vanishing point.

Eventually a rough, clumsy telegraph was put up for demonstration in a room at the university, and here Alfred Vail saw it, and immediately recognized its great possibilities. The son of Judge Stephen Vail, the owner of the Speedwell Iron Works, of Morristown, New Jersey, he was able to give Morse the help which he so much needed, and eventually undertook to make at his own expense a complete set of instruments, defray the cost of securing patents, and devote his whole time to the development of the telegraph, in which he was to receive an interest. Thus it came about that the first telegraph instrument was constructed at the Speedwell Iron Works, and this probably explains why such very heavy apparatus was made. The original relay instrument weighed 300 pounds.

In 1837 Morse applied for a patent for the system, and the next year he and Vail, after giving successful demonstrations in New York and Philadelphia, went to Washington, where a room of the Committee of Commerce was placed at their disposal.

Here the two inventors strung up ten miles of wire, and proceeded to explain the working and practicability of their scheme to Congressmen, men of science, representatives of foreign governments, and finally to President Van Buren, who came with all his Cabinet to inspect the apparatus.

All these people saw and marveled, but very little practical assistance was forthcoming. Fortunately for Morse, however, there was one man who saw the possibilities of the system. He was the Honorable Francis O. J. Smith, member of Congress from Portland, Maine, and chairman of the Committee on Commerce, which at his instigation made a most favorable report to Congress on the scheme. He also offered to become permanently interested in the invention, an offer which was later accepted by Morse, on the condition that he should obtain a leave of absence for the remainder of his term and not stand for re-election.

Congress, unfortunately, was unmoved by the report, and refused to make the appropriation which Morse was seeking for further experiments, and it was not till 1843, ten years after Morse first conceived the idea, that the Honorable C. G. Ferris, an influential member of the Committee on Commerce, became interested, and made another report to Congress, as a result of which a resolution was offered to pass a bill to appropriate $30,000 for further experiments. After a debate in which the Representatives made great fun of the idea (one suggesting that an appropriation to promote mesmerism would be equally worthy), the bill was passed by the House 90 to 82.

The machine shop of the Speedwell Iron Works, at Morristown, N. J., where the first telegraph instrument was made. The boiler of the *Savannah*, the first steamship to cross the Atlantic, was also made here.

It still had to go through the Senate. The session was drawing to a close, and there was much unfinished business. Morse had staked everything on the success of his scheme, and was reduced almost to his last cent. Sick at heart, he sat in the Senate Gallery the last day, March 3, 1843, and watched the clock moving relentlessly on to midnight. At 10 o'clock one of the Senators told him there was not the slightest chance that the appropriation bill could go through so late, so he went back to his hotel, and spent his last dollars to pay his bill and buy a ticket back to New York.

Early next morning, as he sat at breakfast, to his great surprise, Miss Annie Ellsworth, daughter of his friend, Commissioner Ellsworth, the head of the Patent Office, came in and congratulated him, and from her he first learned that the appropriation bill had been signed a few minutes before midnight. Overjoyed with the news he promised her that she should send the first message over the wire.

It has often been claimed that Morse did not actually invent the telegraph, and at one time there was a great deal of controversy over the subject. His own words, in a letter to Congress in 1849, probably sum up the situation best. He readily admits that in the construction of this telegraph he uses many things invented by others. The chief merit he claims is that of so combining things and inventions already existing as to produce a result never before attained, and this is the essence of his invention. Morse had the genius to see the practical possibilities in the electromagnetic experiments of Joseph Henry and others, and the courage and perseverance to develop them. Alfred Vail was his right hand through all this time, and it was on his mechanical genius that Morse relied to overcome the technical and mechanical details of the scheme. The connection of Ezra Cornell with the invention was also an important one, and far-reaching in its results.

It had been decided that the first experimental line should be constructed between Washington and Baltimore, and should be laid underground. A specially designed plow was needed to make the trench between the two cities, a distance of 40 miles, and Mr. Smith found Ezra Cornell, an expert mechanic in a plow factory in Albany, New York, and brought him to Washington. Cornell was a man of "great practical talent, strong convictions, sinewy integrity, a rigid economist, and a man of stern, sound judgment." Years later, when the telegraph had made him rich, remembering his early struggles to get an education, he gave land and money for the university which bears his name, and which stands on the site of the machine shop where he was first employed.

Cornell invented a plow, and the trench was made. A specially constructed five-wire cable was brought from New York, and several miles of it was laid, and then it was suddenly found that it would not work on account of the great escape of current. Consternation prevailed, for more than two-thirds of the appropriation had already been spent, but at the eleventh hour it was decided to place the wire on poles, a copper wire covered with cotton saturated with gum shellac being used. The electromagnets used for the relays weighed 185 pounds, as against the portable ones weighing a few ounces, now in use, and the coils were of heavy wire of the same thickness as the line itself.

May 24 was set for the first public test. True to his promise to Miss Ellsworth, Morse invited her to send the first message. The four words from the Bible which she chose, "What hath God wrought," were flashed over the line to Baltimore, in the presence of a number of officials. In a few seconds they were flashed back again, and the test was complete.

Morse's faith in the practicability of his system was vindicated, but it was still a long time before the public could grasp or make use of its possibilities, and when Morse offered the invention to the government for $100,000 the Postmaster-General said he was not satisfied that under any rate its revenues could be made equal to its expenditures, and the offer was refused.

The inventors then undertook to develop it independently. They planned to extend the line from Washington to New York, and to raise the necessary capital Ezra Cornell and O. S. Wood went to New York and opened an office at 112 Broadway, to demonstrate their machinery on a short experimental line. Permission to string the wires was obtained with the greatest difficulty. People were terrified of this newfangled contraption, and it was only after Professor Silliman, of the New York University, had given an opinion respecting its safety (at a cost of $50 to the needy exhibitors), that the owners of the neighboring houses would consent to the erection of the wires.

The price of admission to see the telegraph in operation was 25 cents, but this proved to be a very slow way of raising the required capital of $15,000, which was the estimated cost of the proposed line between Fort Lee and Philadelphia. The money was finally obtained, but chiefly outside New York, and then only by giving two shares for every one paid for. The Magnetic Telegraph Company, which had been organized with Amos Kendall as president, now started work on the new line, which, on account of the excessive terms demanded by the railways for right-of-way, followed the ordinary "wagon-road" from Fort Lee to Philadelphia.

To stimulate public interest the line between Philadelphia and Norristown, a distance of fourteen miles, was opened as soon as it was finished in November, 1845, but there were practically no messages, and funds ran very low; the assistants had no money and no salary.

Life, however, was not without its diversions. Nobody really knew very much about the eccentricities of electricity or the working of the telegraph, and repairs were always a matter of exciting experiment, as may be gathered from the following letter written at this time from Philadelphia:

"One morning not long after the line was opened we guessed by the tug of the magnet that the wire was broken not very far away. We had no repairer at Philadelphia, so it became Zook's duty to hunt the break and repair it. I therefore directed him to go to Norristown by car, and walk back till the break was found. He

A Woman Talks to Women—and Men

An Interview With the Associate Justice of the Supreme Court of Ohio

By EMERSON ROBINSON

WHILE statesmen of high and low degree and politicians of all parties are seeking to fix the proper sphere of influence of woman in affairs of the nation, there is one woman who refuses to accept a fixed place for her sex and refuses to concede to any one the privilege of dictating certain causes in which she shall be especially interested.

And this is the chief reason why Miss Florence E. Allen, of Cleveland, is a judge of the Supreme Court of Ohio—the highest tribunal in the state—and herself the only woman to be so honored in America.

No one does thinking for Judge Allen except Judge Allen; she has her own views and she holds to them and you can explain your opposite attitude with all the force at your command, and she will tell you in the nicest way possible just where your argument has a flaw—and then you agree with her.

Many views which Judge Allen holds, she cannot discuss; the proprieties of her position forbid her to broadcast her opinions on subjects of which there might at any time be litigation. The judiciary occupies a peculiar place of respect in America in that it is the sole point of appeal whereby people have positive confidence they will get a fair and impartial hearing.

Judge Allen is not one to do or say anything that will impair this confidence in the courts. But there are some things that she can, with propriety, discuss and one of them is the proper place of American women in American politics.

"Every place is the proper place," says Judge Allen. "Why should any one seek to limit the women of America in the full uses of their recently gained franchise? Women should be just as much interested as men are, in any public question. Women are a living, active, responsible part of the commonwealth, holding equal responsibility with men in the conduct of the government.

"Some have said that women are too emotional to consider certain public affairs; that they will permit their emotions to rule their judgment.

"There is too much emotionalism in the conduct of our government; but emotion is not only an attribute of women; it is an attribute of men—a human attribute.

"Men express their emotion in a manner different from the manner in which women express their feeling. They are more apt to shout than to cry; but when it comes to feeling emotion, any one who has watched lawsuits conducted by men lawyers haranguing men on a jury can hardly say that men are not emotional. Every now and then in Congress emotion is so tense that members who represent the various issues can hardly be prevented from engaging in personal encounters. And this was true in the old days when no woman had invaded these sacred precincts.

"As a matter of fact man is not primarily a reasoning person but he is primarily an emotional being. It is always an effort for him to curb his emotions by the process of reasoning.

"Whenever any large grave proposition is offered to men or women, whether dealing with war or measures for the protection of women and children, they should give calm, deliberate attention to its features and scrutinize the facts from every conceivable angle.

"We shall make no progress unless we ground our decisions on facts rather than upon prejudice as expressed in our emotions.

"As an example, suppose that some measure is proposed before Congress or a legislature to remedy by law a condition which has commanded the attention of the people. The various women's organizations and clubs are asked to support it. But they should not be satisfied with hearing only one side. They should read the bill, study it carefully and then hear what its opponents as well as its proponents have to say. One of the faults of the American people is our inclination not to hear both sides of a proposition. Republicans do not often attend Democratic meetings or read Democratic newspapers and the Democrats seldom attend Republican meetings or read Republican newspapers. This is all the more unfortunate because, as a matter of fact, if a man has a slant in a single direction, he should take particular pains to inform himself of the other side of the controversy so that he himself can come to an unprejudiced decision.

"If I had before me in a trial court as a judge a man of whose guilt the preliminary hearing and indictment and all the circumstances of the case tended to show that he was guilty, I should be compelled as a judge to give that man a hearing in every phase of the case and would violate my oath if I did not divest myself of every prejudice in the conduct of the trial.

"If this is the case in a court, why should it not be the case among those bodies which shape public opinion? We sometimes speak of the cabinet of public opinion. That can hardly function fairly unless it gives a fair and unemotional hearing to both sides.

"It has been said in America since women got the vote that we should be used mainly as a channel for enthusiasm.

"Creating enthusiasm for certain objects is a worthy work, but let us by all means scrutinize the objects. It is because we possess 'the emotion of the ideal,' as Kidd says, that we confront certain grave dangers. We should be careful not to let our group act as cheer leaders in a game in which they do nothing but cheering.

"Every measure that we demand must be based upon our knowledge of actual facts. Some, for instance, speak of the codification of international law as a means to end war. Mere codification, using the word in its ordinary sense which is to compile, will do nothing of the kind. Law must be enacted, not merely compiled. To prohibit war, there must be a law against it and there now is no law against war; codification—that is, compilation—will not make one. You cannot find any international case where a nation has been convicted of making aggressive war, of stealing or extortion."

FLORENCE E. ALLEN,

Associate Justice of the Supreme Court of Ohio.

There is another problem—a purely domestic one—which Judge Allen believes should demand the best study of the men and women of America. Admitting that the present period is one of rather loose living, she does not believe that the country is on the road to ruin but she does believe that the young people, now the object of so much discussion, will find themselves and normalcy restored.

Attendant crime, Judge Allen says, is due to a certain extent to our system of criminal procedure in which she sees radical need of reform.

"If there is one thing in America in which the women should be greatly interested it is the delay of the law," says Judge Allen. "This is a subject which has been thoroughly investigated and on which we have many expert conclusions and recommendations. While great gains have been made in the last ten years, much still remains to be done. It is said that in England it only requires a month to six weeks completely to dispose of a murder case after the prisoner has been apprehended. He is found innocent or guilty within that time, before the evidence is allowed to cool. In the United States, judging from my own experiences, it is a remarkable murder case which is concluded in less than a year. This delay favors the criminal as against the state.

"As much of the delay in our courts arises from statutory provisions it cannot be eliminated until the electors through their legislators enact new laws and this is a task which is important enough to enlist the fine devotion of women as well as men.

"Criminologists say it is not the drastic character of punishment so much as speed and certainty of punishment which deters crime.

"In connection with the evil of the law's delay, and it is a real evil, there also is the evil of the 'easy bond.' This arises largely from the fact that courts often are not apprised of all the circumstances. The fact that we have so much delay also complicates the bond situation. The prisoner is presumed to be innocent and, in certain instances, is innocent of the crime of which he is charged. Mistaken identity is always a possibility and the mere fact that a man has been arrested is not proof of his guilt. If the court knew when the application for bond was made that the prisoner would be tried within a week or two weeks, he would be less apt to fix a bond so low as to be out of all proportion with the importance of the case."

Judge Allen has been a student, a teacher, a member of the Fourth Estate, a lawyer, a fighter for equal suffrage, because she believed it was right, and finally won her way to the Supreme Court of a great state.

She is young, vigorous, happy-minded—and capable of taking care of herself in any argument—so if the politicians of America have in mind the limiting of the activities of women to a sphere for "which they are especially fitted" they had better revise their schedules. There's a battle due.

Where Shylock Stacks Golden Hay

Concluded from page 4

interest—and even less, while they in turn handled or negotiated the large transactions through the loaning out of money at usurious rates of interest in the manner indicated above.

Michael's dealings with certain German municipalities and districts are somewhat illustrated by the following. A letter addressed to the firm of J. Michael & Company, Berlin, states in part: "The distress and poverty of the people of the district of S——— and the inexperience of its representatives have been grossly taken advantage of through this business .... (meaning the loan of a large sum of the people's money to Jacob Michael)."

A third bank, the Thuringian "Staatsbank," unfamiliar with Jewish financial methods, loaned a large sum of money to Michael expecting to earn a comparatively moderate profit by charging him only six per cent a month for the use of the money. But what does Michael do? He loans the same identical money to the distressed "Scharlach" banking house in Berlin, at the most usurious rate of interest imaginable—*thirty-three per cent a day!* Quite naturally, it was not long before Scharlach could see no way out to meet his creditors, chief among whom, it now happened, was Iwan Kutisker and the bank soon fell into the latter's hands. But with this step Kutisker became Michael's debtor. To pay back what his (formerly Scharlach) bank now owed to Jacob Michael, it appears that Kutisker also proceeded to borrow money—probably because of a lower rate of interest—from the Thuringian Staatsbank; and it was at this juncture that the huge swindle was suddenly discovered. German financial investigators found an extraordinary case of "robbing Peter to pay Paul"—namely, Michael receiving money from the Staatsbank at six per cent a month and loaning it out again to the Scharlach Bank (later Kutisker) at 33 per cent a day; Kutisker also borrowing funds from the same Staatsbank, to pay Michael the extortionate rate of interest for the loan of the original sum which belonged to the Staatsbank, or more correctly, belonged to the people of Thuringia. A very singular bit of gyration, to say the least.

But the German post office authorities were also among the long list of Michael's victims. In the selfsame month of November, 1923, it so happened that the German Federal Postal Administration (Reichspost) became independent of the finances of the Federal Treasury and, due to the prevailing exigencies, borrowed the sum of four million gold marks from Jacob Michael which it soon repaid in full. Then, as its own earnings and general finances improved to a very appreciable extent during the early months of 1924, and Michael offered to pay a higher rate of interest than did the Reichsbank—which finally paid no interest at all for the privilege of borrowing funds from the Reichspost—the latter began to loan large amounts of its surplus cash to Michael. It was in this manner that Michael received during the first six months of 1924 forty-four million gold marks in cash and credit for which he paid interest at the rate of only 21 per cent per annum. Thus he used German official funds further to oppress Germans. With these and sufficient other funds at his disposal Jacob Michael continued to conduct his profitable profession of "loaning" money to needy Germans and to alien shyster financiers in the same class with himself. In the course of the last months of the aforementioned six months Michael refunded not quite half of the money loaned; the other half is said to have been absorbed by the "Prussian Seehandlung" or "Staatsbank," which is now one of the focal points of the corruption proceedings.

There is at least one German bank among the assembly of dupes, the "Deutsche Giro-Zentrale," which refused to continue extending credit to Julius Barmat early in his career because it "didn't like his looks" and considered most of the many "Konzernen" or trusts to be sheer inflation progeny. At that time it was the German Reichspost who then came to the rescue of the Barmats for "social and economic" reasons (in reality the discharging of employes, decreasing of salaries, and similar frugal measures). *With the help of the Reichspost* the Barmats were able to hold out until January, 1925.

It will thus be seen that the German Jew knows his trade exceedingly well. Why are Germans so innocent as to permit these perversions right in front of their eyes? What can the average German citizen and native do to prevent fraud and corruption at home when his every movement and effort, in a large sense, is completely under the influence and censorship of the alien race in his midst; when even his own chosen representatives become sorely entangled and inveigled in the smooth machinations of the money lenders and swindlers.

And so there is put on record as the climax to the greatest currency inflation (or deflation) fraud in history an exemplification of the most extraordinary direct misappropriation and manipulation of the people's money ever perpetrated in Europe. And still the last word has not been spoken. Corruption runs deep and it is running rampant in most of the civilized world today, the Semitic influence being either directly behind it or indirectly associated with it. What has been done in Germany is but an impressive example of what can be done and will be done elsewhere upon the slightest provocation. The International Jew has quite sufficiently demonstrated that although paper specie may be "worthless" to Germany and to a misguided, deluded world at large which still clings with blind fear to false monetary doctrines, it is nevertheless valuable enough, when subjected to proper manipulation, to burn, if necessary, the greatest of nations, to make a racial holiday.

How Lincoln Met Death

Continued from page 3

Thus, we have quite definitely accounted for the movements of the assassin up to the evening of the assassination.

On Friday afternoon, after learning that the President and Mrs. Lincoln, accompanied by General and Mrs. Grant, would attend the performance of "Our American Cousin" at Ford's Theater that night, Booth went to Grover's Theater, where he wrote a letter intended for the *National Intelligencer*, a local paper. This was to give his justification for the assassination. He intended to post it but accidentally meeting John Matthews, a fellow actor who was playing that night at Ford's Theater, on Pennsylvania Avenue, he gave it to him instead of mailing it and asked him to deliver it the next day. Matthews was so frightened after the assassination that reading this letter and finding that it was a statement of what Booth was going to do, he destroyed it, but testified it ended with the statement, "The moment has at length arrived when my plans must be changed. The world may censure me for what I am about to do; but I am sure that posterity will justify me. Signed, Men who love their country better than gold or life. John Wilkes Booth—Payne—Atzerodt, and—Herold."

During the afternoon Booth called at the Kirkwood House and left his card for Colonel William Browning, secretary to Vice-President Johnson, with a notation, "Don't wish to disturb you. Are you at home? John Wilkes Booth." Booth had known Browning in Nashville, Tennessee. Colonel Browning remarked when handed the card by the clerk: "It is from Booth. Is he playing here?" The explanation that has been made for the card was that the Vice-President being an intended victim, Booth desired to learn what his plans might be for the evening.

G. A. Bunker, room clerk, National Hotel, testified, "I last saw him (John Wilkes Booth) about 7 o'clock of the evening of the assassination, when he passed out of the hotel for the last time. He spoke to me as he went off."

Atzerodt made the following statement before his execution:

"On the evening of the 14th of April, I met Booth and Payne at the Herndon House in this city at 8 o'clock. He (Booth) said he himself should murder Mr. Lincoln and General Grant, Payne should take Mr. Seward, and I should take Mr. Johnson. I told him I would not do it; that I had gone into the thing to capture, but I was not going to kill. He told me I was a fool; that I would be hung anyhow, and that it was death for every man that backed out; and so we parted. I wandered about the streets until about two o'clock in the morning, and then went to the Kimmell House, and from there pawned my pistol at Georgetown and went to my cousin's house in Montgomery County, where I was arrested the nineteenth following."

Payne, when asked by his counsel as to the nature of the conspiracy, replied: "It was a plan to carry off Lincoln and give him up to the Confederates, but when that failed, Booth, who was the only one in earnest, proposed to kill Lincoln and all the Cabinet. All the rest backed out and scattered like a lot of beggars. We never heard of Surratt, of Arnold, or any of them again. I told Booth that I would go in with him, and he preferred to kill Lincoln, while I was set upon Seward. I deserve to be killed, and so does Booth. The rest were women and babies."

General and Mrs. Grant did not attend the theater with the Lincolns that evening, the following reason being given by General Grant in his personal memoirs:

"While in Washington I was very busy for a time in preparing the necessary orders for the new state of affairs; communicating with my different commanders of separate departments, bodies of troops, and so on. But by the 14th I was pretty well through with this work, so as to be able to visit my children, who were then in Burlington, New Jersey, attending school. Mrs. Grant was with me in Washington at the time, and we were invited by President and Mrs. Lincoln to accompany them to the theater on the evening of that day. I replied to the President's verbal invitation to the effect that if we were in the city we would take great pleasure in accompanying them; but that I was very anxious to get away and visit my children, and if I could get through my work during the day I should do so. I did get through and started by the evening train on the 14th, sending Mr. Lincoln word, of course, that I would not be at the theater."

Mrs. Lincoln then invited in their place Miss Harris and Major Rathbone, daughter and stepson of Senator Harris.

About 9:30 Booth rode his horse up to the back door of the theater and called for Edward Spangler, a stage hand, in whose care he left the horse and passed through the theater to the front. Spangler turned the horse over to Joseph Burroughs, a boy who carried bills for the theater. A little after 10 Booth called for whisky at a restaurant adjoining the theater and at ten minutes past 10 re-entered the front vestibule of the theater and asked the time of the night doorkeeper. Then, according to this witness, "he slipped out and walked in again, entering by the door that leads to the parquet and dress circle. Came out again and then went up the stairway to the dress circle."

Making his way to the aisle leading by the wall toward the door of the President's box he stopped and leisurely took a survey of the house, and selecting one of his visiting cards showed it to the President's messenger, entered the door of the lobby leading to the box—closed and barred it and then after peering through the gimlet hole he had made in the afternoon and finding all clear, he opened the box door, pointed the pistol at the President's head and fired the fatal shot.

Major Henry R. Rathbone, who with Miss Harris accompanied the President and Mrs. Lincoln on that last night, graphically describes in his testimony what took place in the box:

"On the evening of the 14th of April last, at about twenty minutes past 8 o'clock, I, in company with Miss Harris, left my residence at the corner of Fifteenth and H streets, and joined the President and Mrs. Lincoln, and went with them, in their carriage, to Ford's Theater, on Tenth street. On reaching the theater, when the presence of the President became known, the actors stopped playing, the band struck up 'Hail to the Chief,' and the audience rose and received him with vociferous cheering. The party proceeded along in the rear of the dress-circle and entered the box that had been set apart for their reception. On entering the box, there was a large armchair that was placed nearest the audience, farthest from the stage, which the President took and occupied during the whole evening, with one exception, when he got up to put on his coat, and returned and sat down again. When the second scene of the third act was being performed, and while I was intently observing the proceedings upon the stage, with my back toward the door, I heard the discharge of a pistol behind me, and, looking around, saw through the smoke a man between the door and the President. The distance from the door to where the President sat was about four feet. At the same time I heard the man shout some word, which I thought was 'Freedom!' I instantly sprang toward him and seized him. He wrested himself from my grasp, and made a violent thrust at my breast with a large knife. I parried the blow by striking it up and received a wound several inches deep in my left arm, between the elbow and the shoulder. The orifice of the wound was about an inch and a half in length, and extended upward toward the shoulder several inches. The man rushed to the front of the box, and I endeavored to seize him again, but only caught his clothes as he was leaping over the railing of the box. The clothes, as I believe, were torn in the attempt to hold him. As he went over upon the stage, I cried out, 'Stop that man.' I then turned to the President; his position was not changed; his head was slightly bent forward, and his eyes were closed. I saw that he was unconscious, and, supposing him mortally wounded, rushed to the door for the purpose of calling medical aid.

"On reaching the outer door of the passageway, I found it barred by a heavy piece of plank, one end of which was secured in the wall, and the other resting against the door. It had been so securely fastened that it required considerable force to remove it. This wedge or bar was about four feet from the floor. Persons upon the outside were beating against the door for the purpose of entering. I removed the bar, and the door was opened. Several persons, who represented themselves as surgeons, were allowed to enter. I saw there Colonel Crawford, and requested him to prevent other persons from entering the box.

"I then returned to the box, and found the surgeons examining the President's person. They had not yet discovered the wound. As soon as it was discovered, it was determined to remove him from the theater. He was carried out, and I then proceeded to assist Mrs. Lincoln, who was intensely excited, to leave the theater. On reaching the head of the stairs, I requested Major Potter to aid me in assisting Mrs. Lincoln across the street to the house where the President was being conveyed. The wound which I had received had been bleeding very profusely, and on reaching the house, feeling very faint from the loss of blood, I seated myself in the hall, and soon after fainted away, and was laid upon the floor. Upon the return of consciousness I was taken to my residence.

"In a review of the transactions, it is my confident belief that the time which elapsed between the discharge of the pistol and the time when the assassin leaped from the box did not exceed thirty seconds. Neither Mrs. Lincoln nor Miss Harris had left their seats. (A bowie-knife, with a heavy seven-inch blade, was exhibited to the witness, stains of blood being still upon the blade.) This knife might have made a wound similar to the one I received. The assassin held the blade in a horizontal position, I think, and the nature of the wound would indicate it; it came down with a sweeping blow from above."

William Withers, Jr., in his testimony tells what happened after the fatal shot was fired:

"I am the leader of the orchestra at Ford's Theater. I had some business on the stage with our stage manager on the night of the fourteenth, in regard to a national song that I had composed, and I went to see what costume they were going to sing it in. After talking with the manager, I was returning to the orchestra, when I heard the report of a pistol. I stood with astonishment, thinking why they should fire off a pistol in 'Our American Cousin.' As I turned round I heard some confusion, and saw a man running toward me with his head down. I did not know what was the matter, and stood completely paralyzed. As he ran, I could not get out of his way, so he hit me on the leg, and turned me round, and made two cuts at me, one in the neck and one on the side, and knocked me from the third entrance down to the second. The scene saved me. As I turned, I got a side view of him, and I saw it was John Wilkes Booth. He then made a rush for the back door, and out he went. I returned to the stage and heard that the President was killed, and I saw him in the box apparently dead."

The assassin was identified by other members of the theater staff and persons in the audience who saw him leap from the box and rush across the stage. In leaping from the box he caught his right spur in the American Flag, "the mute avenger of the country's fallen chief." This threw him to the stage in such a manner that he fractured his left leg at the ankle. Rushing to the rear door, Booth struck and knocked down the boy who was holding his horse, and leaping to the saddle rode away.

During this time Payne was making a wild attempt on the life of Seward, the Secretary of State, and would have succeeded but for an iron brace holding in place the Secretary's recently broken collar bone, and the efforts of the attending nurse.

Atzerodt, as was told in his confession, did not carry out the part assigned him in the plot, did not occupy his room at the Kirkwood or take away the weapons left in the room for his use by Herold, but wandered around on horseback until he learned that Booth had carried out to the end the horrible drama, and Atzerodt, terror-stricken, struck out early the next morning for the home of a cousin twenty-two miles away, where he was later arrested.

At 7:22 the next morning, in the house across the street from the theater, Mr. Lincoln died, without having regained consciousness.

Herold's actions on the fourteenth are best described by John Fletcher.

"David E. Herold came to our stable in company with the prisoner, Atzerodt, about a quarter to 1 o'clock, on the fourteenth of April, and engaged a horse which he told me to keep for him and he would call for it at 4 o'clock. Before he mounted the horse he asked me how late he could stay out with him. I told him he could stay out no later than 8 o'clock, or 9, at furthest. After that hour I became very uneasy about the horse, and wanted to see about it before I closed up the stable; and that is how I got to see Atzerodt and Herold.

The Job of the Immigration Service

About the Work of the Mounted Men Who Patrol the Rio Grande

By MAX BENTLEY

This is the second and concluding article of the series describing the smuggling of aliens via Mexico.

AMERICA seems to have brought peace to Europe with the Dawes Plan, but will some American now think up a way to end the war at home?

It rages on several fronts, this war, this unique war—unique because *we* are being invaded. A hostile rum fleet stands off the Atlantic Coast, while along the Mexican border we are confronted by an allied force of more races than were ever marshaled against the Germans. And it includes nationalities that once upon a time fought with us: Italians, Czecho-Slovakians, Poles, Basques, various grades of Russian Slavs, and Jews from the four corners of the earth. They are the immigrants barred by the quota and the literacy test, but determined to settle among us notwithstanding.

The American takes his blessings for granted. He knows he lives in the most favored of nations and lets it go at that. He does not see his homeland as others see it; it does not occur to him that there are some tens of millions of fellow beings who would like to live in America, too; whose desire to live in America amounts to even more than despairing poignancy. Why, it amounts to life's passion with them, and some hundreds of thousands among these tens of millions from the other side have saved up enough money to patronize the various smuggler rings, and now they stand before the Rio Grande awaiting the supreme moment—the moment to steal across.

To see these things the native American should go down to the Rio Grande and sit in awhile with our immigration men, as I have just done.

The business of smuggling in the alien has reached enormous proportions along that fitful stream. A serious condition had existed there for years, but passage of the new Immigration Act of July 1, 1924, magnified it tenfold.

Why? Because that act reduced the immigrant quota to the lowest figure known, 2 per cent annually of the number of nationals resident in the United States, and based that 2 per cent on the census of 1890. The purpose was to swing the balance of immigrant population back toward where it stood thirty-four years ago, when we were drawing our foreign element from the so-called Nordic strains of Western Europe—the British, Dutch, Germans, Irish, Scandinavians, and Swiss. Our own people, in other words. That explains why the polyglot invader now at our doors hails from Eastern and Southern Europe.

To repel his invasion is an even more pressing task than beating off the rum fleet, for *this* involves the very security of the Republic. It is the riffraff of Europe that stands on the south bank of the Rio Grande. Most of the nations are co-operating with us in our effort to determine for ourselves how—in what numbers and of what nationalities—our increment of population shall be made up. Under the new law we handpick our immigration at the starting place, through our diplomatic service, until the quota represents the best. It is the ignorant foreigner who cannot meet the literacy test of our government or the character test of his own government, that is now attempting to enter by stealth.

This is an era of big business. Every infant industry is nowadays speedily organized, systematized, and developed to the limit of efficiency. When the Congress of the United States decided, nearly a decade ago, to put a stop to indiscriminate immigration, that bit of legislation bore another infant industry. The new Immigration Act—the most stringent of our history—made that industry full grown almost in a day. There is not one smuggler ring; there are many of them—operating from foreign ports, well financed, with organized connections in the United States, and waxing richer and more powerful every day. Our immigration service is getting the facts hot from the bat: from the lips of the immigrant himself, after his thrust has failed.

The new law gives the Nordics all the best of it. For that reason among others, perhaps, but mainly because the Briton is a kinsman and traditionally a friend, we get the fullest co-operation from Canada. Smuggling is negligible on the Canadian frontier considering its length of more than 4,000 miles. But along the Mexican border it is terribly serious because, first, the Rio Grande lends itself to that sort of thing and, second, we have not reached an understanding with Mexico. The river is the boundary between Mexico and Texas all the way from El Paso to Brownsville. By airline the distance is about 700 miles, but by the twists of the river—and that is what counts—it is 1,400 long and lonely miles, mainly across a thinly settled territory. Through the middle and lower stretches the stream has low banks and is easily fordable. Every factor favors the smuggler; at least, until he gets over on our side.

Our failure to get an understanding with our neighbor allows the alien to come right down to the river without hindrance. Mexico has two excellent ports on her eastern shore, Vera Cruz and Tampico. Certain outlaw steamship companies are using them as points of debarkation for human cargoes ultimately destined for the United States—illegally. These companies refuse to submit their passenger lists to our consular agents abroad, and unless we adopt the good old custom of boarding at sea, or until Mexico does something to stop the free passage of American-bound aliens across her territory, we will continue to face a desperate condition at the river.

We treat them too leniently. All the immigration men say so. One exasperated official said: "Why, you'd think, from the way we have to handle them, that we thought we might be entertaining unaware the Grand Duke Nicholas Nickelbiski.

"To illustrate, when we catch them red-handed we can't handle them like other persons caught violating the laws of the United States. They aren't charged with any punishable offense. We can't hold them without a warrant and the warrant must come from Washington. Then we jail them, of course, but they have special quarters and food much better than the common run has, with privileges of exercise. They usually reward us by writing taunts and Red propaganda on the jail walls.

"When we question them we aren't allowed to go after them in the good old way of 'Here, you! Kick in or you know what!' We have to proceed, very cautiously and courteously, along about this line: 'Are you quite certain you are telling the truth?' Or, 'Come now, isn't it a fact that that birth certificate isn't yours at all?' If they get huffy and tell us where to go, why we have to stand it.

"And if the Department decides to deport them, they get a joyride in a special train to New Orleans, a nice steamship ride to New York, and the trip back home—without cost to them. That's the maximum punishment, sending them home at our expense. We know of more cases than one where some foreigner, after a few years in Mexico, gets homesick, or makes his stake and decides to go home and spend it. He hires a peon to skiff him across the river at a point where he is sure our men will find him. After a bit of four-flushing he 'admits' he is an alien trying to enter illegally—and Uncle Sam sends him home rejoicing."

Not providing punishment for the alien himself is the weak place in our armor, immigration men say. The punitive feature is handled under Section 8 of the old law, which covers only a conspiracy. That is to say, it provides a $2,000 fine and term of five years (the maximum) for any person (or persons) who "shall attempt, by himself or through another, to bring into the United States, or conceal or harbor, any alien not duly admitted by an immigration inspector or not lawfully entitled to enter or to reside within the United States." For the alien himself the law provides no punishment.

It doubles the burden of the border patrol. It makes bootlegging the foreigner far easier and safer than bootlegging liquor: easier because the smuggled goods can run and hide, and safer because the bootlegger can abandon his goods any time if hard pressed, as he almost invariably does. Thousands of aliens are caught, but rarely a conspirator.

Three classes of conspirators are at work in Mexico. The first is the *jefe,* or chief. He is the direct agent of the European ring. His representatives meet the ships and take charge of the contraband cargo when it is landed. He sees that his wards are taken to Mexico City, then concentrated at a convenient point near the border—like Monterey or Chihuahua—and then in smaller groups, escorted to the border itself. The six bridgeheads of Juarez, Villa Acuña, Piedras Negras, Nuevo Laredo, Reynosa, and Matamoros are never without some of these strange-looking people speaking strange tongues. We know them as foreigners or aliens or immigrants, but by the immigration patrol they are known by the generic name, "wetbacks."

The second class is the *coyote,* who handles the local movement on either side of the river. A party of wetbacks will be sent to a *coyote* in Nuevo Laredo by his *jefe.* He sees to it that they are kept together, given hotel accommodations at the border, and kept out of sight of our consuls. He coaches his group in the matter of etiquette required by the occasion, "frisks" them of their remaining funds, if they are stupid or trusting enough not to have hidden them, and turns them over to the guide.

The guide rounds out the triumvirate. He leads his charges to a designated point on the river, usually at night, puts them across in skiffs and delivers them to another *coyote* or guide, according to the size of the expedition. They are again drilled on how to answer if approached by suspicious characters (that meaning officers), and, finally, are taken in charge by another guide whose business it is ostensibly to lead them out of danger—past the three lines of defending immigration riders, to the railroad, and thence to their final destination.

Usually the guide deserts them the first night out, leaving them dozing around some camp fire to awake next morning unshepherded; and sometimes he murders them for what they have left. There is no doubt that the muddy waters of the Rio Grande cover the naked bodies of many, many unfortunate foreigners who believed that any crooked game could be played straight. But there are cases, too, where the ship company, the *jefes, coyotes* and guides, all along the line, have faithfully lived up to their contracts.

Here it is that the immigration men meet worthy foemen. Alien bands are sometimes found hundreds of miles in the interior, on railroad trains with colonist tickets, or riding in trucks or touring cars, with ample funds and food. Topographical maps that would do credit to skilled engineers, showing the locations of highways, crossroads, windmills, rivers, bridges, and railheads, are often taken from them.

The most elaborate communication system is maintained. As one immigration inspector described it from his own experience:

"My stretch covers seventy-five miles and I am supposed to handle it with two mounted men. We have twenty illegal crossing places to watch. It is a game of hide-and-seek between us and the operators of smuggler boats. Frequently we find and burn these, and occasionally we sight a boatman, but he is always on the wrong side of the river, sitting in the shade of a mesquite tree and looking as innocent as a newly born *caballito* gamboling in the blue bonnet patch at his feet.

"Long before we arrive on the scene that mysterious 'grapevine' of the Mexican has been working, and the approach of the *empleado* has been signaled to watchers on the water front. Customs and immigration mounted men long ago learned the futility of attempting to slip up on one of these Texas river-front ranches. On each of them the smugglers have a friend or two. The only effective way to catch a boat is to abandon your horse altogether and take to a car; drive boldly up to the ranch, visit awhile, and then depart briskly in the direction of the home station, dropping your partner to return by devious ways and await the movement of the boat.

"It is useless to let your partner out of the car under a mile from the place you want to watch. It used to be the opinion down here that the Mexicans had revived the system of runners followed by their ancestors, the Aztecs. Montezuma, although living in Mexico City, had fresh fish for his breakfast every morning, runners being utilized to convey the fish from Vera Cruz to the capital 200 miles away. My experience is that a modified runner system is in use now, plus signaling. When an officer is sighted approaching a ranch, a courier is started out by a short cut to get the news to the next ranch, and so on, until it reaches the illegal crossing place. The boatman is notified by the hoisting of a red tablecloth from a clothesline or tree. That means danger, and the boatman, if crowded, abandons his craft instantly and goes overside, or hides in the brush. If he has time he rows to the Mexican side, hides the boat in the willows, and awaits the hoisting of a white bed sheet, that being the 'all's clear' signal."

The other side of the picture is more comforting. While Districts Nos. 22 and 23, covering the Rio Grande, are the most important in the United States, while Laredo ranks next to Ellis Island in the number of immigrants *lawfully* admitted in a single fiscal year, it also happens that the defensive strategy has reached something near perfection. The defending force has been quadrupled. Motor trucks with a carrying capacity of sixteen each bear raiding parties from place to place. Captain William H. Hanson, in charge of the larger and more important District No. 22, has posted three splendidly organized lines of defense, and has enlisted the services of hundreds of other officers—customs men, prohibition men, Texas rangers, sheriffs and their deputies, judges, cattle inspectors—to say nothing of having perfected an elaborate system of ranch telephoning.

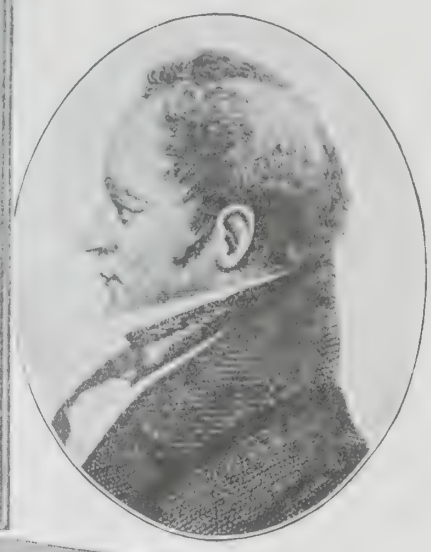
The first line of defense is the river itself. Aliens attempting surreptitious entry come down to the Rio Grande, often to break through there when their destination is New York, because they think it offers the least difficulties, and many do succeed in getting over the river. But their troubles have only started. They enter a lonely country of large ranches and few houses, and

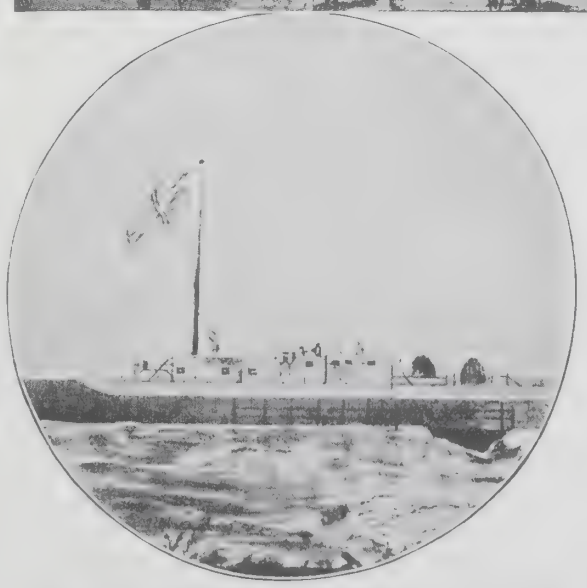
(*Concluded on page 15*)

They are helping throw back the aliens who would enter the United States illegally. Company of the famous Texas Rangers, with the Rio Grande and Mexico behind them.

Regarding 'Company of Adventurers'

How "Merry Monarch" Helped Lay the Foundations of Canada's Trade





Above, left—ALEXANDER MACKENZIE. Center—Dog team and cariole at Fort Garry (now Winnipeg) in 1873. Right—SIR GEORGE SIMPSON. Oval—Interior of Fort Garry. Below—York Factory in 1853 (the great fur capital of the North). Fort York in 1782.

By D. M. LE BOURDAIS

IN 1666 the "Merry Monarch," Charles II of England, had been restored to the throne of his fathers but a short half-dozen years. Having recovered somewhat from the shock of the civil war and experiencing a certain reaction from the restraints imposed by the period of Puritan ascendancy, all England now turned eagerly to schemes of commercial and territorial expansion. Charles, though dissolute and pleasure-loving, was a liberal patron of the arts and sciences and did much to encourage trade and commerce.

Prominent among those cavaliers who found it necessary to derive from the pursuits of peace the stimulus previously found in the profession of arms was Prince Rupert, cousin of the king, the former dashing cavalry leader whose exploits at Edgehill and in other battles of the civil war had set England ringing with his fame.

It was at this most favorable juncture that two interesting and romantic characters appeared on the scene. They were two *coureurs des bois* of French Canada, Radisson and Groseilliers by name, who, believing themselves unfairly treated by the fur-trade monopolists in Canada, crossed the ocean to obtain redress in France; and, failing in this, were induced to proceed to London to lay their wonderful tale of riches and discovery before the English court.

Pierre Esprit Radisson was born in Paris in 1636. At the age of 15 he accompanied his parents to New France, where they took up residence in the village of Three Rivers. The next year, while out shooting ducks, he was captured by the Iroquois and carried by them to their lodges in what is now part of New York State. His audacious bearing saved him from torture and the stake and he was formally adopted into the family of an influential Mohawk chief.

Radisson seems to have adapted himself well to the Indian mode of life; but he longed to return to his people and at length escaped to the Dutch settlement of Orange, now Albany, whence he proceeded down the Hudson River to New York and then by ship to Amsterdam and back to Canada, arriving at Three Rivers in 1654. He found that during his absence his widowed sister, Marguerite, had married a young fur trader, Medart Chouart, who, when a lad of 16 years, had sailed from Rochelle with Maissoneuve in 1641. Chouart, through the subsequent inheritance of a small estate, adopted the title, "des Groseilliers," by which he is known to history.

Groseilliers had spent some years trading with the Hurons and had heard from the Indians of the vast stores of furs which were to be obtained from the natives living farther west and north. He longed to enrich himself by tapping the resources of this great territory. On the other hand, Radisson's was the ambition of the explorer. While a captive among the Mohawks, he states in his journal, he cherished the hope that it would be his destiny "to discover many wild nations."

Their inclinations lying in a similar direction, the brothers-in-law were not long in agreeing on a course of action. Accordingly, in June, 1658, they left Three Rivers on an expedition of exploration and trade among the Indians living beyond Lake Huron. They visited that territory which is now included in the states of Michigan and Wisconsin, and, proceeding southwestward, there seems to be little doubt that Radisson, at least, advanced westward as far as the valley of the Mississippi. Returning, their course lay farther north and they came in contact with Crees and Assiniboines, from whom they heard tales of the fabulous riches of the territory surrounding the Sea of the North.

In the summer of 1660 they returned to Montreal with a brigade numbering several hundred Indians and sixty canoes laden with furs. They were warmly received by the colony, as the increasing ferocity of the Iroquois had deprived New France of much of her former trade.

Their success fired the ambitions of the adventurers anew. They made preparations for another expedition to the *Pays d'en Haut*. But the fur trade of New France was regulated by license and no one could trade without permission from the governor. The success of Radisson and Groseilliers awakened envy in the breasts of the powerful fur traders of Montreal and Three Rivers, so when the explorers approached the governor for the requisite permission they were informed that it would be granted only on condition that they should divide the profits with the governor and also take with them two of his officers to act as auditors.

Naturally unwilling to accede to such a demand, they decided to proceed in spite of the governor, and one night slipped quietly out of the gates of Three Rivers. The next two years were spent in the territory between Lake Superior and Lake Winnipeg, where they built the first trading fort in what was later to be known as the Canadian Northwest; but there is some doubt whether they penetrated as far north as Hudson Bay, although they undoubtedly obtained much information regarding the best route to that region. Returning with another large flotilla of canoes laden with furs to Three Rivers in 1663, the two explorers met with a reception different from their previous one: the greater part of their furs were confiscated and Groseilliers was imprisoned.

Deeply resentful of such treatment, upon his release Groseilliers sailed for France to obtain redress; but in this he was unsuccessful. He then tried to interest French merchants in an expedition to Hudson Bay by sea; but in this, too, he failed. He thereupon returned to Three Rivers and with Radisson left New France and, after a further unsuccessful attempt to reach the Bay by sea, arrived in Boston in 1664. Here the adventurers met two commissioners who had been sent to the New England colonies by King Charles. One of these, Sir George Carteret, became greatly interested in their story and it was by his advice and through his influence that they finally reached England and were presented at the court of King Charles.

Owing to the war with Holland, the great plague and the London fire, two years passed without any very tangible results; but at length the interest of Prince Rupert being enlisted, sufficient funds were subscribed to outfit two small ships, the *Eaglet* and the *Nonsuch*, the latter a ketch of fifty tons.

In the morning of June 3, 1668, the two boats sailed from the Thames on their historic voyage. Radisson was on board the *Eaglet* and Groseilliers in the *Nonsuch*. The former met with misadventure of some sort and was compelled to return to London, but the *Nonsuch* experienced little or no difficulty in crossing the Atlantic and sighted Resolution Isle, at the entrance of Hudson Strait on August 4. By September 29 the Bay had been penetrated to its southeasterly extremity and anchor was dropped at the mouth of a river, which they named the Prince Rupert. Groseilliers and Zachariah Gillam, captain of the *Nonsuch*, landed and took possession in the name of the King of England. They immediately commenced the building of a fort, which was named Fort Charles. After spending the winter trading with the Indians they returned to England with a cargo of furs which more than met the expectations of the promoters of the expedition.

The success of this first voyage led Prince Rupert and his friends to apply to King Charles for a royal charter establishing their right to the exclusive trading privileges on the Bay, which, after some delay, was granted and signed by the King on May 2, 1670.

This charter probably is the most remarkable document of its kind within historical times. With a scratch of quill King Charles—the son of a monarch whose head, a short while previously, had been chopped off by his subjects, and whose brother was to be deposed a few years later by the same subjects—transferred to a group of court favorites, in fee simple, a tract of territory

(*Concluded on page 15*)

The Age of Million-Dollar Stadiums

Receipts Are Very High These Days, But So Are Running Expenses

By PAUL MACDONALD

A previous article showed that baseball draws the largest sums at the turnstiles and costs the most. The sport that comes second in these points is football. The rise of golf and football in popularity during the last five years has been one of the phenomenal features of American life. Ten years ago comparatively few persons cared about golf and still fewer understood football or cared to. Both sports "caught on" and kept expanding at an astounding rate. There has been nothing in sport to equal the growth of these two pastimes.

The gate receipts at football games in 1924 rose to almost unbelievable totals, but while the crowds increased the expense of producing college football went up proportionately. While few cared about football there was no need for million-dollar stadiums and the various luxuries that the game has developed but now, when the popular demand makes a spectacle of the favorite college game, there enters a list of additional expenses.

At the close of the last football season a coach remarked to us about this increased expense in football. "When I played the game," he observed, "we used to employ our worn-out shirts for bandages if we got hurt. Why one day a few weeks ago I saw more bandages put on the foot of one player who complained of a strain than our whole team had put on in any season that I played."

The most recent issue of the football guide gives a list of 392 college teams that play football. Each of these teams has one or more coaches. It also lists 144 scholastic teams that are under football coaches.

There are "major" and "minor" college teams. They have never been specifically grouped. The term "major" applies to the larger schools, the universities. The "minors" are the balance of the field, mostly the institutions known as "fresh water" colleges. To the list of "majors," if such a list existed, additions would have to be made each year, for there is hardly a season when some "minor" colleges do not develop teams that humble "major" elevens. The way football has been popularized has caused many small institutions to develop teams that would well serve any of the "major" schools. While an institution of learning may be known as a "minor" college it can easily have a "major" football team and many of them do.

Something About the Cost of Uniforms

All the "major" football squads have first, second, and third elevens. The first team is the pick of the lot, known as the varsity. The second and third elevens furnish the first and second string substitutes. But to get their regulars and substitutes the coaches have squads of a few hundred from which to pick. For instance, whenever the Ohio State University team took the field last season eighty-three players in uniform ran out on the gridiron. Only thirty-three warmed up, the other fifty squatting on the side lines. While the majority of colleges never bring that many on the field before a game they still have that many and more in uniform and on the various gridirons during practice days. To see 200 and more players working out any afternoon but Saturday and Sunday is a common sight on the playgrounds of the big universities.

More than 20,000 college football players were in uniform last season. The exact number was much nearer 25,000 than 20,000. To get an idea of what it costs to produce football teams consider the money spent at the University of Michigan, an institution that for twenty-five years has been famous for football play and that today remains a representative "major" college. Michigan had 300 players in uniform throughout the season of 1924. The squad of forty that included the varsity eleven were all fitted out in new uniforms while the remainder of the players at Michigan wore old football clothes. The cost of a uniform, itemized, follows: Pants, $8, shoes, $11, jersey, $6, shoulder pads, $5, headgear, $5, woolen hose, $2, underwear, $1.50, sweatshirt or sheepskin coat, $10; total, $48.50. Michigan used 144 footballs during 1924. These 144 footballs served all her teams and players.

To these items you must add the cost of expert coaches. All "major" teams employ a staff of coaches. There is a head coach and then his assistants, a line coach, backfield coach and coach for the ends. Usually there is a coach for punters and forward passers and, not infrequently, a coach for quarterbacks exclusively. Rarely does a team have less than five coaches and nearly all have more. The coaches' salaries will run from $10,000 to $25,000 a season.

College Football Teams Cost Money

Maintaining a football team is expensive, as you will note, but still the expense seems trifling when compared to the receipts. The receipts, however, are used for good purposes. The money taken in at football games pays for the other college sports. Among all college sports football is the only one that pays. In a very few colleges basketball is beginning to pay. Baseball pays in some, but these are rare exceptions, and the figures are small. Football must carry almost the entire list of college sports and the more money taken in at football the more play there will be in other sports at colleges.

These other sports are expensive undertakings. In basketball Michigan provides uniforms for the fifteen members of the varsity squad. These cost $18.50 apiece. To maintain basketball there is a specialist engaged as coach for the players at each of the major schools. Add the salary of this coach and then consider the other expenses, such as railroad travel and incidentals.

College baseball has never aroused any frenzy because professional baseball is so much better that the college game loses by comparison. The baseball squad numbers from 18 to 25 men and it costs between $35 and $40 to equip each player.

Track teams bring little revenue to a university but they have to be maintained at a large expense. There is at least one good track coach and he has one or two assistants. It costs more money to equip sprinters than distance men. Shoes for sprinters cost $9.75 and shoes for distance men cost $6.50. The shoes worn by weight men, jumpers, and hurdlers cost the same as those of the distance runners. Shirts cost $2 and pants, $1.50. The most expensive bit of wearing apparel for track men is the outer garment. This costs $10 but is necessary to protect them when not actually in motion.

Only comparatively few college teams have crews. Most athletic directors are against rowing because of the enormous expense. A crew costs from $18,000 to $25,000 a year. Crews must have training tables. Crews must have a new shell or two each year, costing $1,000 and more. Crews must have a coach and a trainer and handlers. Rowing does not bring in one cent of revenue. It is all going out and nothing coming in with the college oarsmen. The University of Washington crew went from Seattle to Poughkeepsie last June and participated in the collegiate regatta (incidentally winning the event). The trip cost $10,000. It was not possible for the university to pay the expense of sending the crew East but the $10,000 was subscribed by citizens of Seattle. A midwestern coach, who does not approve of rowing because of the enormous cost, told us that when the Washington crew went to Poughkeepsie and returned on $10,000 it was traveling as economically as possible.

There is little expense to college boxing and wrestling. Most major colleges employ a wrestling coach and a few of them employ a coach for boxers. The idea of having boxing is gaining adherents and sooner or later all big colleges will have specialists for this sport.

Soccer is played at many universities and so are tennis, lacrosse, and golf. The expenses of these games are paid by the football receipts. In the last few years polo has been added as a college sport. Polo is making converts in the collegiate ranks each year. Many colleges and universities also maintain swimming instructors. Swimming and water polo are two of the minor college sports. Hockey is another but the hockey activities of college students are limited almost exclusively to the eastern universities.

Equipment for these games runs high, considering the number of sports followed by our institutions of learning. Shoes for athletes are generally bought in large lots. They are not kept in stock by the sporting goods houses and have to be ordered specially. To save time all the major colleges have storerooms of their own. Michigan last year ordered $3,500 worth of football shoes and $1,000 worth of track shoes on the same day. Footballs also are bought in gross lots. From four to six dozen basketballs, costing $9 apiece, are used annually. Baseballs, costing $16 a dozen, generally arrive in 50-dozen lots to supply the varsity squad for a season. Poles used in the pole vault cost $5, javelins cost the same, discuses, shots, and hammers cost $7 each.

Must Turn to Huge Revenues

The upkeep of the play fields of a big college or university costs about $25,000 annually and this does not include improvements and additions. Tennis courts, baseball diamonds, track and field, football gridiron, soccer grounds, all need constant care and attention. Then the athletic office of every college of any size has to maintain a clerical force the year around. That is another fairly heavy item.

Considering these things, football has to turn in huge revenues to make the athletic wheel go around in the intercollegiate ranks. The more people that pay to see football games the more college sports there will be. The cost of staging football is high these days but is low when compared to the cost of maintaining college baseball, track and field, tennis, rowing, basketball, polo, golf, hockey, swimming, wrestling, boxing, soccer, lacrosse, and a few other sports.

Boxing provides some of our huge sport spectacles. You read of "million-dollar gates" at championship matches. We doubt whether any bout ever came near the million-dollar mark in gate receipts, but believe that a million dollars will be paid in the future. If Jack Dempsey, the present world's champion, could find a challenger who, in public opinion, would give Dempsey a hard fight and have a chance of beating him, the gate would easily go above the million-dollar mark. Or, if any promoter could convince the public that he would stage a heavyweight match as thrilling as the one between Dempsey and Firpo, the gate receipts could be run above two million dollars.

There have been some enormous "gates" at recent championship fights but what it costs to put on these matches is rarely considered. Dempsey wants $500,000 to step into the ring against any challenger. He has not defended his title in more than a year. He can afford to hold off more than a year at that demand. While paying Dempsey $500,000 it would also be necessary to pay the opponent of Dempsey a fat sum, probably $100,000 or more. The cost of the arena, the preliminary bouts, the pay demanded by the scores and scores of persons needed in preparing the stage of the fight and handling the crowds and various other expenses connected with selling tickets and getting them distributed, and the publicity, means that the promoter of such a bout must spend $750,000 or more before the men enter the ring. He must take in at least three-quarters of a million dollars; if he takes in any less he loses money. We are not alluding to any past happening but sketching out the next big heavyweight championship battle in which the present title holder will figure.

No fight in the past has cost $750,000, although a few have cost around $500,000. The demands of the champion were not so high at that time. No promoter has ever made big money on big fights. He may have done fairly well on one or two fights but if he continued staging them he experienced as many failures as successes. The cost of putting on a title fight is enormous and the match is not always appealing to the public. Tex Rickard, the best known and most spectacular promoter of all time, has made money on some of his fights but lost money on others. He is probably ahead of the game but not nearly so far as the public thinks. Rickard is the best showman of them all. He knows his public and he knows how to "build" a boxing show. But Rickard was well backed financially in his ventures. Behind Rickard stands Robinson, the circus man, and his fortune. To get his great crowds Rickard has spent money lavishly. He had big gate receipts but he also had enormous expense bills.

Horse racing is conducted on an elaborate scale in this country. It costs much money to maintain a racing stable. The income is never certain but the sport has never lacked followers. There are always enough men willing to risk what they have, or what money they can secure, in a racing venture. Good thoroughbreds are expensive; good trainers are expensive; oats, hay, and barley are expensive, as many owners have concluded when the bills piled up while their horses failed to finish in front. There is, of course, the constant possibility that some youngster will develop into another Man o' War or a racing machine somewhere near the standard of the great one. It is this hope that keeps so many of them hanging on.

Polo Is Being Played Extensively

August Belmont was the most important figure in thoroughbred racing in the United States. Most of the success, the prestige and the development of the sport, were due to the work of Belmont in behalf of thoroughbred racing. He maintained stables and a stud farm for years. It was on his farm that Man o' War and other turf celebrities were bred. But the late Mr. Belmont made money in only a few seasons. Even a man of his position in racing, and one who bred and developed as many stars as his stables carried, could rarely make the game pay. There is a tremendous expense connected with racing and it is a constant expense, 365 days each year and 366 days during leap year. Horses must be kept in condition and trained and fed. To race them you must ship them about the country and this means money. It costs fortunes to maintain the racing establishments. The big tracks pay fairly well some years and other years they do not. One prominent track in Canada had to remain closed last season. The stockholders could not make money with the present high cost of racing.

Most of the other sports that provide spectacles are amateur. One of them is polo. Every three years England (rather Great Britain) and the United States engage in an international match. The most recent of these was held last year. It cost nearly $1,000,000 to play the two games that decided the international polo championships. The gate receipts did not come anywhere near paying the expenses, although record crowds attended. Polo ponies cost much money. Two of them sold for $10,000 apiece at auction immediately after the international matches last September. The cheapest in the lot was sold for $2,500. Trainers and grooms cost money the year around and to bring a string of polo ponies and attendants across the Atlantic is expensive business. Grand stands and various other items make the cost of international polo soar.

Polo is being played extensively in the United States at present. It is played by country clubs and colleges and by riding and hunt clubs. While one team may not use more than twelve or sixteen ponies in a match, few teams have less than thirty-five ponies. There are regular ponies and substitute ponies. Some never get into match play. A polo player may buy twenty ponies before he finds one that suits him particularly well. It is not possible for a player to be as efficient on one pony as he is on another. In polo much depends upon the pony, quite as much as upon the man and, strange as it may seem, a poor player does worse on a good pony than on a poor one while a good player will play poor polo on a poor pony. The pony has to fit the man and the man must fit the pony. The ponies are rated according to their ability, just as the men. A player may not find one pony to his liking in a lot of 100. It is a delicate matter—and an expensive one. Ponies make the game expensive. They have to be trained the year around and kept in condition. They must be well cared for by grooms. They need equipment and this is costly. Saddles, blankets, mallets, bridles, bamboo balls, all figure in the cost of polo. It is no game for the man of moderate means and surely not a game for a poor man. It is played on the largest field used in any sport and the fields are expensive. They must be level and the turf must be smooth. Getting turf into this condition is not so easy as it sounds. A new kind of grass is now used on the polo fields, a thick and tough grass that withstands the hoofs of the ponies and the mallets of the riders better than ordinary grass. Getting this grass started is difficult. It means money, time, and labor.

Will Polo Take the Place of Baseball?

Still, there is nothing more exciting or thrilling than this game of the wealthy man. It cannot but appeal to the masses as well as the classes. We believe that in future years polo is going to be one of the most popular games, that there will be professional polo teams as there are now professional baseball teams, playing in major leagues and organized on a general plan. It may not be looking too far into the future to predict that some day polo will take the place of baseball. The taste of the public changes in sports. If you doubt this statement ponder a few moments and consider tennis, golf, and football, twenty years ago and now.

The Telegraph's Birthday

Concluded from page 9

was then to send a message by planting a piece of wire in the ground and tapping on it with the line wire. That done he was to find a puddle of water in which he was to stand, and, putting the line wire to his tongue, receive my acknowledgment. All went well until this latter performance, which was followed by an ominous silence, and then by the hugest of Pennsylvania profanity. The truth was, the strength of the current had upset him. When an hour or more afterward Sam came into the office covered with mud, and with madness in his eye, we learned our first lesson in the danger of line-testing repairs. What most grieved Zook was that he had performed his electrical gymnastics in the presence of a large crowd, who had rather enjoyed his very original entertainment."

The line between Philadelphia and Fort Lee was finished on January 20, 1846, and the first New York office was at 16 Wall Street, and afterward at Post's Building behind the Merchant's Exchange. Messages had to be sent across the river, whether for delivery or transmission, as no way to carry the line over the North River had been found. Several attempts were made to cross the Hudson, one of them involving a detour of 105 miles up the river to Anthony's Nose, with the wires carried across on high poles. It was not till February, 1856, that the crossing was finally effected by an armored cable insulated with gutta-percha.

The first year was full of discouragement. The wires were down thirty-six days in the first five months, small boys joyfully made targets of all the glass insulators, and at the end of the first year the company's total receipts only amounted to a little more than $4,000.

In spite of this the work went on, and New York and Washington were finally connected when the last piece of the line between Philadelphia and Baltimore was finished in 1846. This line was ordered to be covered with tar, and a newly landed Scotchman was engaged, who, with a tar bucket slung to his side, and a monster sponge in hand, tarred the line as far as Wilmington, Delaware, where, not surprisingly, he succumbed. Nothing daunted, James D. Reid, afterward the general superintendent of the line, himself took on the work, and lathered the line to the Susquehanna.

The year 1846 also saw the opening of the line from Albany to Buffalo, and the following year this was carried on to New York. The New York and Boston Telegraph Company also had a line in operation in 1846. Charges from New York to Washington were 50 cents for the first ten words, and 5 cents for each additional word; to Philadelphia 25 cents and 2 cents for each additional word; and to Boston 50 cents and 3 cents for each additional word, while it only cost 10 cents to send a ten-word message from New York to Newark or Jersey City.

The transcontinental lines which connected New York and San Francisco met at Salt Lake City on November 1, 1861, and since then a vast network of wire has spread out all over the country, till, at the present time, even the smallest towns are connected up by the two million miles of wire that now carry more than 155,000,000 messages a year.

Regarding 'Company of Adventurers'

Concluded from page 13

many times greater in extent than that over which his forefathers had ruled for more than 600 years; with power of life or death over all persons within that territory; with authority to make whatever laws they believed to be necessary; to undertake war or to make peace; in fact, no greater or more extensive powers were possessed by the lords and barons in the darkest period of the feudal ages. These rights and privileges so lightly conferred were to remain in force and effect for two full centuries—long after the Stuarts themselves had been shorn of their power—in spite of many attempts by force and by law to set them aside, until voluntarily relinquished by the successors of those original grantees.

The charter provided that "Whereas Our dear and entirely beloved Cousin, Prince Rupert, Count Palatine of the Rhine, Duke of Bavaria and Cumberland," and so forth, together with other noblemen, knights, and esquires including such personages as the Duke of Albemarle, the Earl of Craven, Lord Arlington, Lord Ashley—the two latter being members of the famous Cabal—Sir Philip Carteret, Sir John Kirke, and others, and "John Portman, Citizen and Goldsmith of London, have, at their own great Cost and Charges, undertaken an Expedition for Hudson's Bay . . . . for Discovery of a new Passage into the South Sea, and for the finding some Trade for Furs, Minerals, and other considerable Commodities, and by such their Undertaking, have already made such Discoveries as do encourage them to proceed further in Pursuance of their said Design, and by means whereof there may probably arise very great Advantage to Us and Our Kingdom. . . ." Then follows the official name of the company—"The Governor and Company of Adventurers of England Trading into Hudson's Bay"—regulations covering the appointment of a governor and a governing committee, and the names of the first governor—Prince Rupert—and the first committee.

The charter then went on through five closely written sheets of parchment to set forth in detail the powers, perquisites and privileges of the company; and it does not seem that anything which could have been desired by the petitioners, and granted by the king, was not included.

After the charter was obtained the company lost no time in entering into possession. By June in the same year all was in readiness for another trip to the Bay. Radisson and Groseilliers set out with three ships containing a stock of wares with which to conduct trade with the Indians. With them sailed also Charles Bayley, the first local governor of Rupert's Land. They established Fort York, now known as Port Nelson, which was destined to be for many years the fur capital of the North.

The articles mostly in demand by the Indians at this period were muskets with powder and shot, brass kettles, knives and hatchets. Some years later, however, supplies of tobacco, glass beads, red lead, looking-glasses and certain articles of fancy clothing were added to the cargoes.

The beaver skin became the standard of value and other furs and all articles of trade were rated as being of the value of so many "made beaver" or in a certain proportion to the value of one "made beaver." The trade values of some of the staple articles of trade in the early years of the company are as follows: 1 musket, 12 beaver skins; powder, 1 beaver for one-half pound; shot, 1 beaver for 4 pounds; hatchets, 1 large and 1 small for 1 beaver; knives, 8 large and 8 jackknives for 1 beaver; beads, 1 beaver for one-half pound; kettles, 1 beaver to the pound; tobacco, 1 beaver to the pound.

The later history of the Hudson's Bay Company will appear in an early issue.

How Lincoln Met Death

Concluded from page 11

"At about 10 o'clock, having a suspicion that Herold was going to take the horse away, I went across E street, and up Fourteenth street, till I came upon Pennsylvania Avenue, close to Willard's, where I saw Herold riding the roan horse. He seemed as if he was coming down from the Treasury upon the Avenue. He was passing Fourteenth street; the horse was pulling to get to the stable. I suppose Herold knew me by the light of the lamp, for he turned the horse around, and I hallooed to him, but he put spurs to it, and went, as fast as the horse could go, up Fourteenth street, making no reply to me. That was about twenty-five minutes past 10.

"I then returned to the stable for a saddle and bridle and horse myself, and went along the avenue until I came to Thirteenth street; went up Thirteenth street to E; along E until I came to Ninth, and turned down Ninth street to Pennsylvania Avenue again. I went along the avenue to the south side of the Capitol. I there met a gentleman, and asked him if he had passed any one riding on horseback. He said yes and that he was riding very fast. I followed on until I got to the Navy Yard bridge, where the guard halted me, and called for the sergeant of the guard. He came out, and I asked him if a roan horse had crossed that bridge, giving him a description of the horse, saddle, and bridle, and the man that was riding. He said, 'Yes, he has gone across the bridge.' 'Did he stay long here?' I asked. He replied, 'He said that he was waiting for an acquaintance of his that was coming on; but he did not wait, and another man came riding a bay horse or a bay mare, right after him.' 'Did he tell you his name?' 'Yes, he said his name was Smith.' I asked him if I could cross the bridge after them. He said, 'Yes, you can cross, but you cannot return.' I said, 'If that is so, I will not go.' So I turned around and came back to the city again."

Abraham Lincoln, himself, explained the laxity of the guards in allowing Booth and Herold to cross the Navy Yard bridge. Just before starting for the theater, two men who wanted a pass that they might get through the lines to go to Richmond called at the White House. Mr. Lincoln gave them the following notation:

"No pass is necessary now to authorize any one to go to and return from Petersburg and Richmond. People go and return just as they did before the war.

"A. Lincoln."

Let us follow the escaping assassin across the bridge from the testimony of Sergeant Silas T. Cobb:

"On the night of the 14th of April, I was on duty at the Navy Yard bridge. At about half-past 10 or 11 o'clock, a man approached rapidly on horseback. The sentry challenged him, and I advanced to see if he was a proper person to pass.

"I asked him, 'Who are you, sir?' He said, 'My name is Booth.' I asked him where he was from. He made answer, 'From the city.' 'Where are you going?' I said; and he replied, 'I am going home.' I asked him where his home was. He said it was in Charles. I understood by that that he meant Charles County. I asked him what town. He said he did not live in any town. I said, 'You must live in some town.' Said he, 'I live close to Beantown; but do not live in the town.' I asked him why he was out so late; if he did not know the rule that persons were not allowed to pass after 9 o'clock. He said it was new to him; that he had somewhere to go in the city, and it was a dark night, and he thought he would have the moon to ride home by. The moon rose that night about that time. I thought he was a proper person to pass, and I passed him. (A photograph of J. Wilkes Booth was shown the witness.) That is the man that passed first. He rode a small-sized horse, rather an undersized horse, I should think, a very bright bay, with a shining skin, and it looked as though he had just had a short burst—a short push—and seemed restive and uneasy, much more so than the rider. In all, I had some three or four minutes' conversation with him before I allowed him to pass.

"In perhaps five or seven, or, at the outside, ten minutes, another person came along. He did not seem to be riding so rapidly as the first, or his horse did not show signs of it as much as the first. I asked who he was and he said that his name was Smith, and that he was going home; that he lived at the White Plains. I asked him how it was that he was out so late. He made use of a rather indelicate expression, and said that he had been in bad company.

"Afterward, a third horseman rode up, and made inquiry after a roan horse; after a man passing on a roan horse. He made no inquiry about the other horseman who had passed first. He did not seem to have any business on the other side of the bridge that I considered of sufficient importance to pass him, and so I turned him back."

The assassination had caused a veritable reign of terror in Washington. The city, which had been in constant celebration over the Northern successes, can best be understood by those who were in any large American city on Armistice Day, November 11, 1918.

The reaction caused by the assassination of the President and attempted assassination of the Secretary of State led to the belief that a general southern plot was on foot to kill all members of the Cabinet. Arrests were made on all sides.

A succeeding article will describe the pursuit and capture of John Wilkes Booth.

The Humor of Will Rogers

Concluded from page 5

in the spotlight, Rogers kidded him about the city administration.

"Well, I see by the papers," he drawled between twirls of his busy rope, "that Mayor Hylan went down to examine the subways and he couldn't get in. . . . You know, New Yorkers are like gophers. Whenever they see a hole in the ground, they grab a nickel and duck for it. . . ."

The mayor laughed good-naturedly and sat down again, but not until the cowboy-comedian told him he might.

Here are some more lines that Rogers has pulled—selected at random from several different performances:

"What this country needs is more men to plow fields with a plow and not with a brassie."

"Our public men are speaking every day on something, but they ain't saying anything."

"Well, I see by the papers that the *ZR3* uses 2,000,000 cubic feet of gas and somebody with a sense of humor named it the *Los Angeles*."

"I've got a solution for the traffic problem in this country. Let all the folks going East go Mondays and all the ones going West go Tuesdays."

Some other actor asked him, "But how about North and South?"

Rogers looked at him condescendingly and replied, "There's no longer any North and South. We're all one."

"I am often asked where I get all my jokes. I just watch the government and report the facts."

Speaking of our National Defense program, he said: "Every time France or England builds a ship, we sink a bigger ship. No matter how fast they build them, we can sink them faster and bigger. And if they sink a bigger ship than we've got, why we go right ahead and build a bigger one and sink that. . . . America, the country that never lost a war or won a conference."

From these illustrations, you can see that he injects into every remark his own shrewd brand of humor. But as is often the case, the written word does not have the effectiveness of the spoken word. Will Rogers' deliberately slow and easy-going drawl and his very confidential tone of voice makes his remarks sound much funnier than they seem in type.

All the while he talks, he does remarkable tricks with ropes but few persons notice what he is doing while he is talking. When he stops chattering for a second and they see him whirling two ropes at once they begin to applaud, and he says:

"Thass right, go ahead and cheer Art if you feel like it. I'll tell you this. It took a lot longer while to learn this stuff than to learn to speak a piece."

There's more truth in his statement than the average person who hears him say it believes. He has been practicing with a rope since he was old enough to stand up.

"I get hard-boiled once in a while," he confessed, "and tell the stage doorman not to let anybody in to see me. He tells them I'm out but somehow or other they manage to get past him. I don't really mind."

The day we called on him, he was playing a matinée. We would never have guessed it from his manner.

He leaned back with his chair propped against the book-laden dressing table and proceeded to chat until the call boy announced it was time for him to appear on the stage.

He came back a few minutes later and picked up the thread of the conversation where he had dropped it. He didn't have to go on the stage again for half an hour. In that time, he recounted some of his experiences in his eighteen years on the stage.

The Job of the Immigration Service

Concluded from page 12

every house has a telephone. If they are not seen and reported by ranchmen they come to the second line. It is eighty to one hundred miles in the interior, and holds the highways leading into towns, and bridges over rivers and creeks. If the alien gets through there he reaches the nearest railroad center—and there meets the third line, posted around depots or cheap lodging-house districts or foreign neighborhoods, and trained to single out instantly the character whose garb and speech and actions show he is new to the country. If he runs the third cordon he earns his freedom—but few succeed in running it.

Indeed, few ever reach the third line of defense—the second line usually gets them. They are in a strange land, dependent on guides. If they attempt to buy food their speech betrays them. When they sleep it is beside camp fires, and the night is made horrible by the howling of coyotes (*real* coyotes) and other imaginary dangers. They must travel the back country, and that means long stretches without food or water. Every one's hand is raised against them; they have many enemies and not a friend. At the first sign of danger they are usually deserted by their guides. Such a combination will defeat all but the hardiest and most determined and resourceful blockade runners. In most cases, when they are finally captured they are bewildered, frightened, penniless, ready to tell the truth, eager to be sent home—an unhappy and disillusioned lot.

So it is that our famous deportation train—a special operating across the continent every two weeks—never lacks passengers. It follows the "rim" route from San Francisco to New Orleans *via* El Paso and San Antonio, sometimes dropping its cargo of deportees at New Orleans for transfer to ship, sometimes continuing straight to New York. Most of its passengers are supplied by the Rio Grande patrol. Often they are a defiant lot, shouting taunts as they are borne through American villages and towns. Again they are cheerfully glad to be homeward bound (without expense) after the baptism of fire they have passed through. But sometimes they sigh and weep as the countryside of the land of their dreams unrolls its marvels before them—through a car window.

From their point of view it may all be very sad, but from ours, whatever their mood may be, it is a good riddance of rubbish—practically without an exception.

THE LIBRARY OF THE
UNIV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. The set includes: "The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

Speak not to the great man more than he requires, for one knows not what may be displeasing to him. Speak when he invites thee and thy word will be pleasing.—Precepts of Ptah-Hotep, 2500 B. C.

Dr. Sun Yat Sen, late President of Southern China, was once one of Greenwich Village's literary colony.

Aerial prospecting of the mineralized triangle bordered by the Yukon, North West Territories and Alaska is being carried out by a Vancouver engineer who has found large deposits of coal and iron in this region.

Narcissus, iris, marigold, bluebells, lilies and lupines grow wild in Algeria.

Two million dollars' worth of gold and silver was carried by airplane from London to Amsterdam in a single flight.

Richard the Lion-Hearted, during the Crusades in 1190, ruled that no person in the army beneath the degree of knight could play any sort of a game for money. Knights and clergymen might do so, but no one was permitted to lose more than 20 shillings in one whole day and night, under penalty of 100 shillings.

In the bakeshops of Rangoon, Burma, men sit with their bare feet in the flour, rolling the dough and frying puffs and doughnuts.

When the baseball hero makes an extraordinary play and the crowd goes wild, the extra strain on the grand stand amounts to 300 pounds a square inch.

The largest shipbuilding plant in the world is at Belfast, Ireland.

Enough soap is made by the Near East Relief Orphanage of Alexandrapol in Armenia to bathe their 12,000 orphans and still have some for sale.

Rouge is colored from a preparation made from the cochineal insect.

A gold-plated walking stick with a perfume holder in the top was carried by Henry the VIII.

Thirty tons of locust eggs were collected in the single month of March during a locust plague in Argentina in 1915.

Baron Hermann Augustus Adalbert de Buderus von Carlshausen, of the European nobility, is "door-slammer" of the Bridgeport, Connecticut, fire department. His duties are to close the doors of the engine house after the apparatus leaves, in return for which he gets his lodging.

Thirty falconers on horseback had charge of Edward III's hawks when he invaded France.

The episcope is an instrument that enables a surgeon to work alone in a perfectly quiet operating room, and at the same time permits an audience of medical students to watch the progress of the operation in a separate room.

Epictetus, the philosopher, in the year 89, was exiled from Rome and Italy by the Domitian edict against all philosophers.

The world and all things in it are valuable, but the most valuable thing in the world is a virtuous woman.—Mohammed's writings from the Koran.

Chemicals in quantities so small as not to injure fish or plant life are being placed in ponds and creeks of New Jersey to kill the mosquito wigglers which have jaws and feed on bacteria and other minute forms of life.

A through service from London to Paris without changing cars or alighting from the train will become effective shortly, when huge ferryboats carrying trains are put into commission between Dover and Calais.

The chamois of the Alps are being blinded by a new plague.

The Snake Indians were so called because of the characteristics of these natives in quickly concealing themselves when once discovered. They seemed to glide away in the grass, sagebrush, and rocks and disappear with all the subtlety of a serpent.

Tobacco seed, from which cigaret tobacco is grown, is so tiny that a single tablespoonful will produce plants enough to cover ten acres.

A 2,000,000 franc gold vein in a rock under the ruins of the Chateau de Machecoul, one of Gilles de Laval's (Bluebeard) strongholds, has been discovered. One of the misdeeds which weighed most heavily in his trial for sorcery was "the manufacture of gold," which the baron, together with an Italian alchemist, was accused of making with the blood of the 800 victims as the chief ingredients.

The Island of Formosa in the South Pacific possesses the highest sea cliffs in the world.

The ancient Romans used wire ropes and regulated the water supply in their homes by means of bronze plug valves similar to those we use today.

Heat, conducted through a large pipe to the interior of a stack of green hay, dries it as effectively as would the sun. In England, where damp weather prevails, this is a common practice.

Tej, the national beverage of Southern Abyssinia, is distilled from wild honey and is similar to the mead of the ancient Saxons.

Cairo, Egypt, a city of many languages, has adopted the automatic telephone system.

Be active, during the time of thy existence, doing more than is commanded. He is blameworthy who makes bad use of his moments.—Precepts of Ptah-Hotep, 2500 B. C.

The Island of Java is the most densely populated country in the world, 35,000,000 persons living on an area smaller than the State of Iowa.

CHRONICLER OF THE NEGLECTED TRUTH

"I Read in the Papers—"

I read in the papers that a New York man has given his 12-year-old son a $10,000,000 property that the lad may begin where his daddy leaves off. What a wonderful world ours would be if that were possible. If each generation began where the other left off, avoiding its mistakes, increasing its gains, carrying forward the vision! But it doesn't. This world has all the characteristics of the first grade at school. One class of beginners is taught and passes on. But the next class is beginners again. You can't say, "We shall now close up this first grade; the class is gone on; the next is a higher grade." No, for already new first graders are at the doors. Everything that's known, all the essential wisdom of life, was known long ago, but each generation seems to be a new first grade. The same old elementary lessons, the same old elementary errors; and presently enough of a b c and of one plus one to justify going on. The schoolroom has improved a bit, the slates and pencils and books, all the machinery of experience has improved, but try handing on your wisdom to your son; try handing on to this twentieth century the bitterly learned lessons of the first, try handing on last year's arithmetic wisdom to this year, and see how far you get. And perhaps it is all right.

I read in the papers that an old offender says once a man goes wrong, he is gone for good. Doubtless this is true of the congenital criminal, the man who has it in his blood, and whose social inhibitions have been broken down by his first taste of lawlessness. The tame tiger is not reclaimable after he has tasted blood. It is not true, however, of men who by accident and law have been temporarily classed as criminal. The notable quality of the old offender's statement is its contrast with the mawkish sentimentality that would place prisoners above others in the scale of humanity. An army nurse tells me that she was always finding the army judgment right and her own sympathetic estimates wrong in the cases of army prisoners she has had to handle. The difficulty is to maintain between the hard-boiled disciplinarian and the sympathetic sentimentalist the true balance of humanity. "Ma Pendleton," in one of Harry Leon Wilson's stories, had it sized up pretty well: "Prison reform, that was the first topic on which she delivered addresses to me. She could talk at length about the innate sterling goodness of the misunderstood burglar. I got tired of it. I told her one day that if you come right down to it, I'd bet the men inside the penitentiaries didn't average up one bit higher morally than the men outside. She said, with her pleasantest smile, that I didn't understand; so I never tried to after that."

I read in the papers that more than two-thirds of a million persons living in the United States today have been child brides who were less than 16 years of age when they were married, or have been married to child brides under that age. These facts have been made public by the Russell Sage Foundation. But then, it ought to be pointed out, there are fourteen states in the Union where marriage is permitted when girls are 12 years of age and boys are 14. If the marriage of children is allowed by law, is there anything extraordinary in their taking advantage of this law? It seems to have become a question in many parts of the country as to what a "child" is and what it is not. It is one of those terms that are used in a vague and indiscriminate manner. What is considered a "child" in one state is looked upon as an adult in another, but under no circumstances is the term more loosely and absurdly employed than when speaking of "child" labor. Under this statute, would those boy and girl husbands and wives be liable to purishment for performing the duties of their own household or supporting their own children? Or would it be necessary to engage a nurse or guardian not only for the boy and girl couple but for their children?

I read in the papers that there have been prosecutions for using the mails to defraud in the case of teachers of show-card writing and other things by which people are supposed to make fortunes in their spare time. What may be called the tuition fake, or schemes which pretend to teach almost every subject under the sun—"for a consideration"—is becoming a very widespread means of money-getting. In many of those schemes the "correspondence school" idea seems to be uppermost; that is to say, you can sit at your fireside, as it were, and have access to a special college course without the trouble of going to college. No doubt good work has been done by correspondence schools honestly and legitimately conducted, but this does not do away with the fact that there are thousands of more or less incompetent young men and women who are anxious, for the aforesaid "consideration," to tell the world where to succeed where they themselves have failed.

I read in the papers of the Flettner "rotorship's" successful voyages. According to our daily press, this product of German ingenuity is "sail-less, crew-less, and motorless." However, the Manchester *Guardian* is still published; and from the columns of this journal I learn that the "rotorship" can make headway "without a motor, without sails, and with a smaller crew than a regular schooner or steamer," but "must be looked upon as a sailing ship with an auxiliary motor, or a motorship with an auxiliary sailing apparatus, the one always auxiliary to the other." The special correspondent of the *Guardian*, who voyaged on the "rotorship" *Buckau* across the North Sea to Grangemouth, on the Firth of Forth, says further: "When operating with the rotors alone she is handled virtually like a schooner." This correspondent concludes that, like Fulton's steamboat, the "rotorship" must go through a period of development. ". . . . one cannot have a rotorleviathan all at once." What! "cannot?" It is very evident that the *Guardian's* correspondent has had little experience in our daily press.

MR. FORD'S Page this week discusses Tennyson's vision in "Locksley Hall" of the airplane as a peace instrument. (p. 7)

"PEOPLE who *talk* poor, and *live* poor, and *think* poor are very apt to *stay* poor," says Mrs. Shuey in "The Poverty Complex" on page 5. Much sound sense is in this little bit—far removed from the aerated nonsense sometimes uttered on this subject.

THIS is a pretty good "food for thought" number of THE DEARBORN INDEPENDENT. For example:

There is a look across the sea to the "Dole" in England. Judson Grenell tells more about that practice than any writer has ever told. When you read this, you have it all. (p. 6)

THEN there is a dash into a big American question. How much of our increased government cost is due to our regulation of lawless business? Never thought of that, did you? The man who writes it knows. He is in a position where he sees it all. His statistics will amaze you. (p. 2)

THE farmer cannot be left out of any discussion today. Yet so much of the advice given to him is wrong! Is it cheaper to limit crops, or to raise the largest possible crop? The answer is not just another guess. Let the city man read it, too, and get the idea. (p. 12)

"THEY were born in April but they were not April Fools," is a biographical article on April's gift of men to the race. (p. 3)

AND then there is a delightful ramble through old Cape Cod, by shore and bypaths, with nice pictures of old cottages and gateways and lights and dunes. Everybody likes to read about Cape Cod. (pp. 4 and 5)

THE Booth Myth is being effectually laid by this paper. File the articles away, for hereafter no one can discuss the theory that Lincoln's assassin escaped without referring to the complete and final investigation made by F. L. Black. He recreates history and every step he takes is based on copper-riveted facts. The third installment is a thrilling narrative of the flight of the fugitives as far as Port Royal. (pp. 9 and 15)

IT IS a rather readable Editorial Page this week. Some real ideas scattered here and there in it. The radio is killing jazz—glory be! The boss who finds his workmen going bolshy need not look for the cause in agitators, let him look for it in himself. How would it do to start an American newspaper in some of our cities where it is now "jingoism" or "slush" to sound the American national note among the dozen other national notes constantly being sounded? Is Josephus Daniels right about Mellon, Hoover and Butler? Are the Republicans right in their treatment of party critics? Is the speculative market an index of business? No! A half-dozen ideas worth mulling over. (p. 8)

INSECTS that give rich gifts to us—a charming little excursion into entomology (p. 11) and parasites (human) that take half a billion a year from American easy-marks with a few dollars saved up (p. 10)—constitute quite a contrast between human nature and just Nature.

How Much Has It Cost U. S. to Regulate Business Combinations?

How Far Is the Centralization and Growing Cost of Government Chargeable to the Law-Violating Tendencies of Big Business?

By HUSTON THOMPSON

Copyright, 1925, by Huston Thompson. All rights reserved.

ONE day in the spring of 1884 my father brought his sons to Washington to view the sights of our Capital, hoping that the inspiration derived from this visit would make better citizens of us.

I recall that the most exciting thing we did was to go to the top of Washington Monument and look over the city. Within the last year I again ascended the monument and saw below me a great city of nearly a half-million persons. It so happened that I was looking down at the hour when the employes of the government were leaving their offices for the day.

Now, if I could have assembled the number of government employes in Washington, as well as those outside of it, for the years 1884 and 1924, in groups on the ellipse back of the White House and looked down upon them from my lofty elevation, I would have seen in the one group a few thousand persons and in the other 548,531. Such a contrast, when we consider that between 1884 and 1924 the per capita cost of government increased from $5.65 to $31.80, suggests some interesting queries: Why, for example, so tremendous a growth in the roster of Federal employes? Excluding the throng that has been added through the increase for national defense, *how many are employed directly or indirectly to meet the problems thrust upon us by the centralization of economic power in great business combinations?*

A 600 Per Cent Increase in Forty Years

Is there an increase in proportion to the normal expansion of the nation's business? What is there to this hue and cry against bureaucracy and centralization in Federal control over 110,000,000 in the Federal Government?

On that same day in 1924 I had occasion to go into the galleries of Congress and listen to earnest and almost despairing criticism against bureaucracy and centralization, but no explanation of their causes. A perusal of the debates of Congress for some years past reveals that the criticisms of 1924 were but a repetition of discussion over a subject that has disturbed our statesmen for many years.

In the business world I have heard anathemas uttered against government bureaus and commissions and "their interference with business." It has become a commonplace to tag this Senator or that Congressman with the word "Demagogue" or "Socialist," because he may, perchance, have advocated the creation of a new bureau or commission; yet I venture to assert that the harassed Senator or Congressman, who is doing his utmost in his desire to register the will of his constituents, would exclaim in despair that he knew of no other way of meeting their wishes.

The whole system of pyramiding new departments, bureaus, and commissions upon the government with the resultant increase in its cost and the removal from local communities of control over their own affairs seems to have been at all times condemned. It is strange, then, that Congress after Congress has continued to treat the disease with the panacea of more centralization.

The psychological effect upon the individual and his initiative who has lost or been compelled to surrender his local sovereignty for a long period of time can be measured, if we will but cast our vision across the ocean to youthful governments like Esthonia, Latvia, Lithuania, Poland, Czecho-Slovakia, and others that have recently sprung up from under the yoke of former great centralized nations of Europe. Here, for the first time in more than 100 years, the people are being permitted to work out their own salvation and rule themselves under a democratic form of government.

In a number of these countries last year I asked the leaders what was the greatest problem they had to meet in the splendid upward struggle they were making from a very humble and weak beginning. The universal answer was that, having been compelled under the old system to surrender the function of local self-government, they had to grope their way back to the art of ruling themselves. To recreate this idea in the minds of the citizenry was the great problem.

In the light of the experiences of these nations and the principle of self-government that guided our forefathers in founding this great Republic, this problem of more centralization of government should be kept ever before us and we should seek a clearer understanding of its causes.

There is a mistaken idea abroad in the land that Federal government officials seek to initiate movements to take away control of affairs from local governments. My observation has been that control has usually been thrust upon Federal officials. Once intrusted with it, the departments usually absorb more power, unless they are manned by remarkable officials who must use their greatest efforts to prevent more power drifting toward them.

U. S. Officials Not Eager for More Control

Consider one phase of the situation. When the Packers and Stockyards Act created the bureau in the Department of Agriculture for regulating the Packing Industry, it was not long until it came into conflict with the livestock regulations of the State of Minnesota, which had been giving satisfactory results. Both houses of the Minnesota legislature and the governor petitioned Congress in an unsuccessful effort to prevent the new Federal law from displacing their own state regulatory machinery. It would have been an excellent combination to have had the state officials take care of the intrastate business of the packers at St. Paul and the Federal Government supervise the interstate business.

> Bread—Eight companies bake 12% of the 12,117,600,000 pounds used annually in the U. S.
>
> Anthracite Coal—Eight companies produce 75% of the hard coal used in the U. S.
>
> Flour—Eight companies control 27% of the U. S. output of wheat flour.
>
> Farm Machinery—Five companies control 90% of certain lines of farm implements.
>
> Steel—Eight great combinations, originally 130 independent companies, control 50% of the steel output of the U. S.

But there is a no-man's land between interstate and intrastate business over which it seems impossible to define the control. Some one must control it and if we set up Federal bureaus to regulate industry, it is certain that, sooner or later, they will be called upon to supervise the business of the industry in this twilight zone. Recently I called a learned Federal judge's attention to the problem of controlling this zone of doubtful jurisdiction and asked him how it was to be bridged. His reply was that he presumed the Federal Government would have to license all corporations doing an interstate business and forfeit their licenses if they transgressed their limitations. The obvious objection to this plan was that it called for more centralized control than ever.

If Federal officials do not usually seek to initiate the movement for power, where does it originate? It is my opinion that we will discover in the business world both an explanation and a remedy for this unwelcome expansion of our national government. To advance along the road to a solution we must enter the great arena of business and analyze the complex movements which confuse the ultimate consumer and the average citizen and note the effect.

Bigness Is Not the Danger Point to Be Guarded

After years of close-up study of business enterprises and their effect upon the public welfare, I have observed that they may be classified into two groups. The first of these gives the government practically no trouble, for they do not cause centralization of power. In this group are the co-operatives, such as the Minnesota Co-operative Creameries, composed of 475 farmer owned and operated creameries. Among all the Farmers Co-operatives in the United States in but two instances have any been summoned before government officials for their practices.

There are also the Consumers Co-operatives of the cities, who, buying only for their members and not being in a competitive business, have thus far produced no disturbing effect in Washington.

Another type is the individual corporation, which seeks a fair profit from its business by selling its output at a reasonable or lowering price and at the same time keeping up the quality. Often these individual corporations have grown more rapidly and received greater monetary returns than combinations of corporations who have taken over and absorbed their competitors through purchase or otherwise.

There are also "Trade Associations" in this group which serve a useful purpose both for their members and the people. They have energetic secretaries who are constantly co-operating with the Federal Trade Commission in seeing to it that some of their members cease practicing unfair methods of competition. These secretaries and their supporters who are in the majority in their organizations are elevating the standards and efficiency of their industry in many ways. This class deserves to be put on a public honor roll.

But there are other associations of corporations loosely joined together in organizations who start out with the best of intentions but who soon step across the legal and lawful zone and indulge in price fixing or regulation even though they already have before them decrees of our courts forbidding them again to practice this method of business so irritating to the public.

Adam Smith and Calvin Coolidge See Eye to Eye

Of the association groups there is still another class that is forever before the Federal authorities for legislative investigation or judicial action. Possibly having their prototype in mind, Adam Smith of England, the great economist, over a hundred years ago, indulged in the following language: "People of the same trade seldom meet together, even for merriment and diversion, but the conversation ends in a conspiracy against the public or in some contrivance to raise prices." This was the same Smith who was perhaps the greatest fighter of all time against price fixing and control—the effect of whose teachings are said to have saved England from a revolution.

President Coolidge, recently quoting this statement of Adam Smith's said:

"If trade associations could be so conducted that the public might be assured of all their potential advantages, and at the same time safeguarded against the disadvantages incident to restricted competition and the exaction of too liberal profits, they would render a large service to the community, and would be assured of a corresponding measure of confidence and support.

* * * * * *

"We have had a good deal of evidence in our own time that this dictum of the wise old Scotsman is quite as applicable in one generation as in another. It is this trait of human nature which has in more recent years compelled society to adopt regulative measures to protect itself. I am sure we can all agree that organizations of this kind will command the greater public confidence, and be the more capable of lasting usefulness, if they recognize the danger of falling into such practices."

These price-fixing groups have fought in the courts the efforts of the government to obtain current data so that it could be given to the ultimate consumer, as well as the Trade Associations members, thus putting the consumer on an equal footing with the seller in the market place.

When Business Combines Against the Public Welfare

The records of our courts show that these associations have indulged in lawlessness, such as blacklisting all those who did not live up to their price regulations and attacking those who were not members of their association. When government officials, seeking to enforce the law, have halted them in their tracks, they have raised a hue and cry of "less government in business," and when brought before the bar of justice they have pleaded that the law was indefinite, though they have been told repeatedly by the Supreme Court of the United States just what the law is. In the files of some of the cases I have examined was found the advice of skilled lawyers who told their members what the law was and warned them against the very practices in which they proceeded to indulge. In one form or another they have set up schemes of gathering data and at the same time distributing this information to the members of their association together with facts regarding stocks on hand and a formula by which they can compute the approximate price which they should charge. These have led to curtailment of production and to increased as well as uniform prices.

They have been able to regulate not only prices in groups of states, but, by sending messengers back and forth to the several groups, to keep from competing with each other, have brought about a price regulation throughout the entire United States.

It is a significant fact that in a study of the records of hundreds of these price-controlling associations, *I have never yet found those in control making a drive toward reducing prices.* On a rising market their letters and communications to each other or to other groups at a distance are a series of urges to advance prices. On a falling market, after a buyers' strike, the effort is to prevent price reductions and to maintain or increase existing levels by curtailment of production or otherwise. It is little wonder that the ultimate consumer looks on mystified and troubled and, finally, after discovering that these groups cannot be controlled except in small part by local officials, hurries to Congress for aid.

The Great Extent to Which Combination Has Grown in U. S.

There is no hope for avoiding runaway prices, curtailment of production, buyers' strikes, and unstabilized markets so long as this type insists on indulging in this foolish and dangerously injurious practice which, as the experience and history of other nations and our laws show, have always condemned.

It is impossible here, for lack of space, to give more details of their methods. They are, however, so simple that a child could tell that their practices would eventually bring them under the ban of the law.

Finally, there is the type consisting of a mammoth combination of corporations whose authority is centralized in one super-corporation. Compared in size with the Independents in the same industry it is like the giant trees of California that dwarf all other surrounding vegetation by contrast. More or less silently there has come together in practically every business that supplies the necessaries of life one of these combinations which produces or controls from one-third to 90 per cent of the commodity in the respective industry. So great is its power and so dominant the control that to name the price of a commodity is tantamount to fixing the minimum price for the Independents during normal times. It thus brings about in effect an autocratic minimum price control. The Independent fears to upset this price except in times of utter depression after a buyers' strike, when all control is thrown into the discard and the com-

(Concluded on page 14)

Born in April, But Not April Fools

Some Immortals Born in the Month of the Golden Daffodils

By THOMAS L. MASSON

WHO are these extraordinary persons, among many others too numerous to mention, who have all been born in the so-called fickle month of April?

Two of the greatest poets in the history of English literature, and a third who ranks well up in the list of immortals.

The greatest historian (with possibly one exception) and another who comes very close to him.

Three American presidents, one of whom saved the Union, another of whom founded one of the great political parties, and a third who had more influence over our foreign policy than any American, with the possible exception of Washington.

The first Prince of Wales.

Of all Europe's historical kings, the one who looms the largest.

Four of the greatest philosophers in the history of the world.

The most distinguished oldest inhabitant among us, alive today.

Two of England's greatest novelists, and one who, by competent critics, is considered the greatest American novelist thus far.

America's most popular, if not the greatest, naturalist.

Two great soldiers, perhaps the greatest that England and America have produced.

The man who discovered the circulation of the blood, one of the most far-reaching discoveries in the history of medical science.

The European statesman who is held by many responsible for the European war.

The most celebrated pioneer among Arctic explorers.

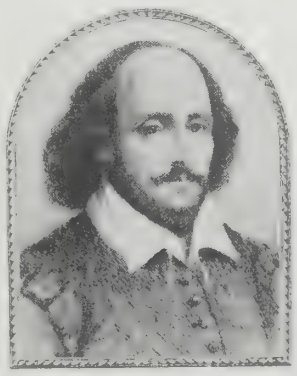
Two of the greatest literary critics.

And one Queen of England.

Keystone View Co., Inc.

JOHN BURROUGHS

Of this great gallery of immortals, four pairs were born on the same day, and three—the greatest English historian, the greatest American soldier and the greatest English philosopher—were born on the same day. The most belligerent European statesman was born on the first day of the month and the mildest of England's queens on the last. The greatest poet (Shakespeare) was almost certainly born on the same day of the month that he died. He was baptized on April 26, it being highly probable that he was born a day or so before, and he died on April 23. He was apparently the only one in the whole list who died in the same place in which he was born, with the exception of Immanuel Kant, who was born in Königsberg, Prussia, April 22, 1724, and died there February 12, 1804. During the whole course of his life, Kant never went more than a few miles from his birthplace; the neighbors used to set their clocks by his daily walk. He was very familiar with geography, and, indeed, knew more intimately more regions of the globe than those who lived there. It is doubtful if Shakespeare ever went much farther afield than London. Kant undoubtedly had the greatest philosophical intellect in the history of the world. Shakespeare ranks as the greatest poet. The fact that neither of them had the opportunity of going on a Cook's tour around the world reveals the great disadvantages under which they lived. The two other poets born in the same month with Shakespeare are William Wordsworth (April 7) and Algernon Charles Swinburne (April 5). Shakespeare was made notorious in this country by Ignatius Donnelly, who, in 1887, made a great stir with his books, in which he attempted to show by a cryptogram that Francis Bacon was the author of Shakespeare's works. Up to last year the best biography of Shakespeare was by Sidney Lee, but I am inclined to think this has been exceeded in merit by the one issued a year or so ago in Boston (Houghton) by J. Q. Adams.



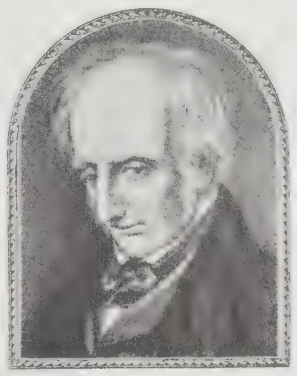
WILLIAM SHAKESPEARE

As for Swinburne, the other great poet (born April 5), that he was astonishing nobody doubts; that he was a great poet, however, is very doubtful. I refer the reader to two delightful descriptions of him, one by Henry Adams in his book, "The Education of Henry Adams," and the other by Max Beerbohm in a book of essays entitled, "An Even Now." The piece referred to is titled "The Pines."

As for Kant and his three fellow philosophers, some of my readers may recall that his centenary occurred last year. It is interesting to know that he got his chief inspiration from Hume, and both he and Hume were undoubtedly as largely influenced by Hobbes, all of these three philosophers being born in the month of April, Hobbes on the fifth, Kant on the twenty-second, and Hume on the twenty-sixth.

The remaining or fourth philosopher was Herbert Spencer, born on April twenty-seventh. It is doubtful which one has had more influence on Americans, Spencer or Kant. Emerson, and succeeding him, the whole Harvard school, got a great deal of their inspiration from Kant. The transcendentalists originated in that way. Spencer has influenced a great many of our writers. Lafcadio Hearn is one. Spencer had small use for Kant, and understood him not at all. Kant's forbears were from Scotland, and he is thus, in a sense, racially related to Hume. Kant's great book, "The Critique of Pure Reason," was declared to have had more influence than the French Revolution; it undoubtedly shook theology to its depths and is responsible, in a way, for the whole modernist movement.

As for Hume, he is the only one in the April list who serves in a double capacity, unless we admit that Cromwell was as great a statesman as he was a soldier. Hume was not only notable as a philosopher, but as the author of a History of England, a monumental work of its kind, which, however, has been relegated to the musty shelves of old libraries; whereas, the same cannot be said of Gibbon's Decline and Fall of the Roman Empire, without question the greatest general history ever written, and—in the opinion of the best critics—superseded only by Thucydides' History of the Peloponnesian War. Edward Gibbon was born on April 27, 1737, at Putney, Surrey, and died at London, January 15, 1794. The history of his boyhood development as a historical student, his friendship with Madam Necker, his method of writing, his own estimate of himself, and his great book itself, all afford a subject for study and meditation, to say nothing of instruction, which is unsurpassed in interest. His Rome is today being constantly read by a great many of the ablest persons. Many years ago I passed an entire winter reading it through. I secured a number of wall maps of historical geography and plastered my walls with them, much to the perturbation of my landlady, and, thus accoutered, plunged into the five volumes, containing in all about a million words. Last year Arthur Guiterman, one of our best poets, told me he was then in the midst of reading Gibbon, and his enthusiasm over it so got me, that I began it all over again. I am now in the third volume. It is without doubt the greatest historical reading in the world, and if any of my readers are tired of the movies and cross words, and want to pass a year away from active business, let them read Gibbon. In the recent biography of Olive Schreiner, author of "The Story of an African Farm," it is recorded by her husband that she kept a volume of Gibbon's Rome by her bedside for years, and rarely went to sleep without reading it.



WILLIAM WORDSWORTH

As a birth month, April has done fully as well with the novelists as with the historians and philosophers, if not the poets. She has not produced the best novelist, but she has produced perhaps the first one who gave form to the English novel (if we except Richardson) and the author of what by many is really considered the best novel ever written, namely, "Tom Jones." And in addition to Henry Fielding with Immanuel Kant, the philosopher (born on April 22), she has produced Anthony Trollope (April 24, 1815) and, in this country, Henry James (April 15, 1843). Of these three novelists, Anthony Trollope has been coming back during the past few years; a great deal has been written about him; his merits are being widely discussed and better understood. Of Henry James it may be said that his earlier work has scarcely been surpassed in American fiction writing. If the reader is interested in novels, I advise him, as an experiment, to get out "Tom Jones" and read it over. Viewed in the light of our modern jazz fiction, it will seem like dull reading enough. But the after-effect is very valuable; it is the best background to all novel reading of which I am aware. After it has been read, then Trollope and Henry James will be much better understood.

Our literary list is not yet exhausted, for, in addition to those named, April has bequeathed to us two of the most notable critics of all time, after the Greeks. One of these is H. A. Taine (April 21, 1828), and the other William Hazlitt (April 10, 1778). Taine's English literature still remains the most acute and intelligent survey. I doubt if it has been surpassed by any English writer. Hazlitt has, in many ways, been superseded by the moderns. He was a pioneer, and the background he furnished for modern criticism was an essential link in the line of traditional progress, although I am bound to say that mere opinion on any subject interests me less and less all the time.

As for our April statesmen and soldiers, the list is formidable. As a statesman, Charles the Great (Charlemagne, April 2, 742) is by far the greatest. To modern eyes, he has long since faded from the historical perspective. But in the long line of first rank statesmen he holds his place.

Next to him April gives us Oliver Cromwell, much more picturesque and indeed modern, as he stands for liberty and the rights of man. If this statement seems exaggerated, it must be remembered that he can only be regarded in the light of his own age.

The third statesman is Otto Eduard Leopold von Bismarck (April 1, 1815) who was born about two months before the Battle of Waterloo: the Iron Chancellor, who built up the modern Prussia and made it into the formidable machine which was designed to crush the world.

In this list of statesmen, although in my introduction he belongs to another group, I can scarcely omit the name of Thomas Jefferson (April 13, 1743). Even today the clouds of misunderstanding which hover around the memory of our third President have not blown away. His remarkable defects, and his still more remarkable qualities, have not yet received the attention of a great biographer. This leads me to say that all great men would be much better understood if we would but meditate below the surface of events, and, in the light of a rational psychology, realize that they are but puppets, the product of unseen forces, or universal law; in short, they are human beings, originating nothing in themselves, but the ones who, for their own periods, prove to be the best to carry on the work. This accounts for their weaknesses, for their often lamentable lapses after the "event" is over.

ALGERNON SWINBURNE

Grant, as President, cuts a sorry figure beside Grant as a soldier; but that fact does not diminish his true greatness. He was without doubt our greatest military genius; and in the long line of soldiers produced by England Cromwell stands very high.

As for two other American statesmen, one of whom I have stated had so much to do with our foreign policy in the past and another of whom it is still too early to form a just estimate, I will relieve the curiosity of the reader at once by telling who they are: James Monroe (April 28, 1758) and Charles Evans Hughes (April 11, 1862). In our historical record, Monroe is chiefly known because of the Monroe Doctrine. Mr. Hughes is now no longer a factor in our foreign policy, and it is much too soon to estimate his influence upon our history.

Of the April names remaining on my list, it is interesting to observe that William Harvey (April 1, 1578) was born on the same day of the month as Bismarck, thus bringing into sharp contrast the respective claims of those who create in the silence of laboratories and those whose genius lies more in the sphere of active events. It is extremely doubtful if Bismarck, in the long run, contributed anything but blood to the world's assets. William Harvey contributed the circulation, which is much more valuable. Without Harvey, modern medicine would not be what it is.

Only two Englishmen remain to chronicle. One is the first Prince of Wales, King Edward II (April 25, 1284), and the other is Sir John Franklin, the Arctic explorer (April 16, 1786). The only English woman, and the last on the list is Queen Mary II (April 30, 1662).

In America we have Fisher Ames, that minor American statesman whose main contribution to immortality (not inconsiderable) is that he declined the presidency of Harvard College. And we have John Burroughs (April 3, 1837).

The career of John Burroughs illustrates a striking idiosyncrasy in the law of heredity, which biologists have yet to account for, and that is, how genius will pass over all the members of an ordinary family and fasten itself upon one. This was true of Washington, of Franklin, and of Mark Twain; and it was equally true of Burroughs. He passed a great deal of his time when young with his brother. After his first book was published, Burroughs took the copy he got and pushed it across the table to his brother. His brother looked it over, and tossed it aside. To him it was unreadable. One had eyes in his head, and the other had not.

Much later in life Burroughs was more than satiated with the attention some of his works attracted. In regard to "Waiting" he once said: "I almost wish I had never written the poem, they pester me so about it." Comments such as these were evoked by the multitudinous requests for autograph copies of the poem. If a particularly bold attack was made, for example, when one person asked for three copies, he would say, "Tell her to fold her hands and wait till the spirit moves me to grant her modest request."

HERBERT SPENCER

I have mentioned one other distinguished American now alive as being the most notable among the oldest inhabitants. I refer to Chauncey Depew, born at Peekskill, New York, on April 23, 1834, and still going strong at ninety-two. If his difficulty in holding off Father Time was not made so easy by his sense of humor, I should say it was due to the fact that he has never grown up. Anyone who has heard him make a speech or tell a story will know what I mean.

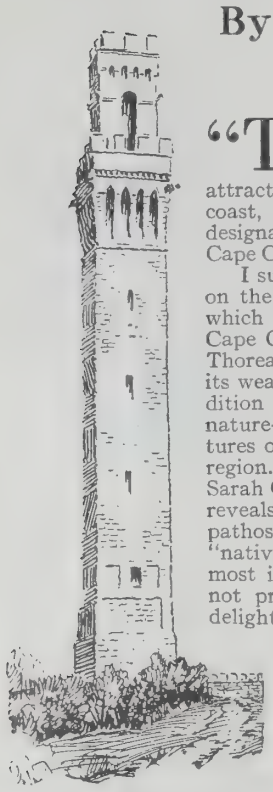
High Lights in New England

"The Cape," to a New Englander, Is Only One Place—Cape Cod

By FLORENCE TAFT EATON

(Illustrations by Stanley W. Woodward)

Sand dunes on the Cape.



The Pilgrim Tower—tall, impressive granite shaft.

"THE Cape," to a New Englander, is only one place—Cape Cod. We have many attractive capes on our picturesque coast, but all except one must be designated. "The Cape" is always Cape Cod.

I suppose there is no one locality on the entire Atlantic Coast about which more has been written than Cape Cod. To begin with, there is Thoreau's delightful volume, with its wealth of allusion, anecdote, tradition and—last but not least to a nature-lover—his enchanting pictures of the flora individual to that region. In an entirely different vein Sarah Greene, in "Cape Cod Folks," reveals the characteristic humor, pathos, and idiosyncrasies of the "natives" in a way which, although most interesting to the reader, did not prove wholly satisfactory and delightful to the aforesaid natives; so far from delightful, in fact, as to ward off further projected literature along similar lines. Walter Pritchard Eaton has given us one of the most charming pictures of the Cape which I have ever seen; and various authors of note—and otherwise—have each taken a hand—or rather a pen—in paying tribute to the various attractions of that picturesque curving arm of land with which Eastern Massachusetts incloses one of the finest harbors on our or any coast.

On the principle that dwellers in the shade of Bunker Hill Monument seldom climb that sky-piercing elevation except when initiating visitors from afar into the traditional experiences held necessary for their conventional historical sight-seeing, I, although a New Englander, had never made the tour of the Cape until a four-days' motor trip was suggested, which should conduct us to its famous tip, Provincetown, and include as much as possible of the beauty and interest of the whole region. I adore "trips," and what more fascinating than a trip around our famous Cape? September—that month perhaps most beautiful of the whole year in New England—promised us fine weather, a magnificent display of foliage, and the gorgeous flowers with which Nature decorates this beautiful spot in the autumn. In fact, the great beauty of the Cape flora simply demands a paragraph to itself. The sea air always wonderfully increases the luxuriance and coloring of the flowers in its neighborhood, and this particular region includes, besides the ordinary varieties, many specimens that are rare and unusual. Wild roses are always magnificent near the sea, growing in luxuriant masses of vividly green foliage and wonderfully brilliant and abundant blossoms, ripening, in the autumn, into clusters of vermilion tips, as lovely in their way as the flowers. The coast goldenrod is in a class by itself as to size, luxuriance, and beauty. I can never refrain from loading every possible bit of vacant space in the car with especially lovely specimens to take home. On this particular trip I gathered goldenrod seed, and tempted it to reward me by the later appearance of at least a few seedlings; the inland conditions, however, did not suit it, and not one seed germinated. Great patches of *Lobelia cardinalis* occasionally delighted us, as did the different gentians, both bottle and fringed; and various orchids and the delicate storied Sabbatia reward the searcher for rarer blossoms. Ironweed (*Vernonia*), joe-pyeweed (*Eupatorium*), blazing star (*Liatris scariosa*), purple whole stretches with their glowing masses; and the brilliant sumacs—never so luxuriant as when near the sea—with their deep cardinal clubs of fruitage, and the rich green bayberry clumps, their branches and twigs silvered by the closely clustered gray-white berries, are among the especially attractive natural beauties of the Cape.

The very names of the Cape towns are intriguing. Sandwich, Onset, Yarmouth, Dennis, Chatham—each name calls up pictures of its characteristic beauties and points of interest; and finally Provincetown itself—that individual, "different," picturesque and altogether delightful settlement, nestled on the tip end of the Cape, inclosing its own safe little harbor, and backed by the picturesque sand dunes—the most wonderful on the New England coast. These brilliantly white sands, piled to miniature mountain ridges, are continually shifting and support little vegetation but coarse beach grass, occasional sprays of goldenrod, dwarfed bayberry, and some of the characteristic beach plum, the fruit of which produces one of our finest jellies. Eugene O'Neil, the well-known dramatist, lives during the summer in the old life-saving station, which the shifting sands each winter do their uttermost to obliterate.

The Pilgrim Tower, a tall, impressive granite shaft, stands on the highest point of land, Town Hill, and is climbed with enthusiasm—at least at the start!—by the enterprising tourist. Race Point Lighthouse points the way of safety to the mariner.

Provincetown is more and more becoming an artists' colony. One sees them everywhere, returning season after season to paint the dunes, the quaint streets and quainter houses, the tiny, gay gardens, the bits of characteristic architecture, the wharves, docks, and fishermen. Their umbrellas spring up like gigantic mushrooms, not only decorating the countryside, but calmly taking possession of streets and sidewalks when the artistic frenzy so directs. But it is surely true that Provincetown has a lure all its own not only for the artist but for the casual visitor, and one who has once succumbed to it always returns, sometime.

The motor roads leading around both sides of the Cape and to its extreme tip are wonderful—which adds much to the pleasure of the tourist.

Running through Wareham and Onset—the latter including, besides its many beauties, a section that might be called the Coney Island of the Cape—we enter the enchanted Cape country via Buzzard's Bay, where the famous Cape Cod Canal now divides the cape region from the mainland—a stupendous undertaking magnificently accomplished, and most interesting to the tourist as a spectacle. From Buzzard's Bay to Wood's Hole, where, had we time, we would linger to inspect the U. S. Marine Laboratory, the Naval Station, and, as ardent horticulturalists, the beautiful Rose Nursery there located. Wood's Hole now overlooks the busiest harbor on the Cape. Fine summer places are located between here and Falmouth, and Wood's Hole includes a fine eighteen-hole golf course. Falmouth itself, besides being a noted summer resort, full of modern and convenient summer houses, has its traditions and permanencies. It is an old settlement and includes many dignified and attractive Georgian houses, century-old trees, and "old residents." Falmouth Heights, directly overlooking the Bay, is a cool and delightful spot in which to spend a week-end or a whole vacation.

The motor road now leads east, running along the South Shore. The Buzzard's Bay shore is somewhat characteristic, with its bulwark of back country and its coast line indented with enchanting bays and inlets, outlined with wooded hills and rocky promontories. It includes many pleasant hot-weather resorts and the former summer homes of Grover Cleveland and "Joe" Jefferson. From Falmouth along to Hyannis and "The Port," then Cotuit, the home of the famous "Cotuit Oyster," Osterville, Centerville, and Craigsville—the latter noted as a fashionable summer settlement and for its delightfully warm sea bathing. It is said to be one of the most popular watering places in the world and in the same class as Coronado Beach and Ostend. A short diversion toward the south brings us to lovely Wyanno—always connected in my mind with particularly beautiful Sabbatia, which flourishes with especial luxuriance in sheltered sandy corners, and with its wonderful cathedral pines. An attractive clubhouse, where one may spend delightful week-ends—or longer—is one of Wyanno's many pleasant features.

Hyannis, one of the largest and gayest towns on the Cape, and Hyannis-port on the adjoining bluffs, are popular and populous summer places, where the gay and great of the summer world congregate. Not for this reason—far from it!—but on account of the fame of "Eggleston's"—Eggleston of the wonderful antiques and the as wonderful lobster suppers—we selected Hyannis as our first night's camping place—if one could be said to camp, in the midst of old mahogany, cherry, and china. The clams and lobsters were all our fancy painted; and the night's rest among the antiques most satisfying. Hyannis shops are intriguing, too; but we sternly resisted most of their blandishments and pushed forward on our journey.

Cape cottage—delightful in its perfection of proportion and simplicity.

Yarmouth—bringing inevitably to mind the English Yarmouth, "little Em'ly," David Copperfield, Steerforth, and all the rest—and the Dennises are tree-shaded, attractive villages, followed by the Harwiches, where the country is flatter and more like the ordinary seacoast. Next is Chatham, located at the very peak of the southern point and in the line of all the fresh sea breezes that sweep in from the Atlantic and Nantucket Sound. With such a location, isn't it natural that Chatham should be an ideal summer resort, and that more and more persons should visit it every year? Here are big hotels, a country club including the Eastward Ho! golf course, promising to become one of the finest courses in the country, luxurious summer houses, tennis courts, and, besides, all the vacation activities—sailing, bathing, canoeing—connected with the sea.

At Orleans the motor road joins that outlining the Bay Shore of the Cape, forming one roadway leading to Provincetown. The ride through the narrow arm of the Cape—only six miles at its widest—is

The Cape was once a maritime settlement.

most interesting. Somehow the sensation that one is on such a narrow space separating limitless bodies of water makes for romance and an undoubted thrill. On the east, the wide Atlantic thunders continuously, even in fair weather, and is sufficiently terrifying during storms to necessitate the number of lighthouses and life-saving stations that dot the entire outer coast. A strange life indeed must be lived in these and one that only the very unambitious or the inconceivably philanthropic would be willing to undertake. In old days the canny natives corralled the aid of the Almighty in caring for his own; for a town ordinance decreed that a portion of every storm-tossed-up whale should go to the financial support of the minister. "With what anxiety," notes Thoreau, "must the ministers have watched the waves during a storm!" The outer shore of this narrow arm of the Cape consists of an unbroken seabeach backed by a steep cliff 150 feet in height at its highest point. Thoreau's trip, narrated in his "Cape Cod," took took him along this lonely pathway from Eastham to the tip of the Cape. It is stated that the envious sea is continually, although very slowly, eating away this protecting narrow arm. From the top of the cliff is one of the most magnificent views imaginable.

Highland Light, one of the most important larger lights in this section of the New England coast, is the nucleus of a summer settlement and reached by a crossroad. One would hardly expect a golf course in such a location, and I do not know who was enterprising enough to envisage one; but here it is—a nine-hole course—laid out on the top of the bluff, with, I imagine, as much in the way of "hazards," "obstacles," ravines, gorges, and so on, as any course ever planned. As the Cape is so narrow at this point, and distances between towns short, this course is conveniently available to many. It must be, at all events, sufficiently picturesque.

Typical lighthouse on the Cape. Lighthouses dot the entire Cape.

The return trip from Orleans leads us through quite different scenery and environment. Brewster is a town of shaded streets, many all-year inhabitants, and many fine old houses.

Here, as in all of the most attractive Cape towns, many of the small, old-time houses have been purchased by the summer people and modern conveniences added, with care taken to preserve, as far as possible, the charm of the old-fashioned architecture. Flower beds and borders are carefully tended, ancient well-sweeps cherished as picturesque accessories, old doorways preserved, and the Old and New brought into congenial companionship.

Dennis and East Dennis are farming towns, with fewer modern summer places, retaining more of the old-time atmosphere and conditions. "The Sign of the Motor Car," at East Dennis, had been our objective as our last night's stopping place, and most charming we found it. Two simple, unspoiled Cape cottages, joined at right angles to each other, provided accommodations for guests, the vine-covered inclosed corner making a delightful outdoor tea room. The most fascinating and beautiful antique furniture and accessories filled every room, the inevitable gift-shop both allured and entertained, and the food! Well, it was worthy of house and furnishings—one could praise it no more highly! Truly, mine host and his clever wife did well to acquire this charming rooftree, and he, as cook and host, wrought kindly by his guests, in allowing them to advantage by his search for health.

En route to Plymouth, where we lunch on the beautiful beach, with the long rollers rhythmically tumbling in, on every variety of sandwich the mind of man—or woman—could devise; a last memento—at a cost!—of the "Sign of the Motor Car." Our road runs through Yarmouth, the Branstables, and Sandwich—an enchanting ride, with views of the Great Marshes, the hills to the south, and the glistening sand dunes. Sandwich glass, made half a century ago in the old glass factory in Sandwich village, is celebrated for its beauty and becomes more and more desirable—and costly—as time passes. Plymouth is so full of interest and charm as to be another story; but we are now off "The Cape" proper, and must reluctantly call our pilgrimage at an end. I cannot, however, refrain from a word as to the attractive "Green Briar Canning Kitchen," to which we were tempted by a sign at the entrance of a fascinating little lane. Here the country people find a market for all the garden and wild fruits of the region, and here, in the cleanest, shiningest, and most convenient long, one-story "kitchen," the fruits and berries are converted by culinary experts, with the aid of a long row of bright, glowing little stoves, each topped by its steaming kettle of bubbling, spicy, fragrant fruit, pickle, or piquant sauce, into every variety of canned delectability, jelly, and jam, that can be imagined. The salesroom, with its rows of richly colored, labeled jars and tumblers, is a sight to tempt her last cent from the appreciative visiting housewife. Christmas and other holiday baskets of the different products, to be packed and sent to any distance, are a specialty of this fascinating "Green Briar."

The larger, beautiful old houses in the principal towns on the Cape are mostly Georgian, with wonderful old doorways and picturesque accessories, and eighteenth-century colonial, simple and beautiful. Many of the two-story houses have the back hip-roof, slanting to the first story, with elm-shaded ornamented doorways in front. The typical illustration "Cape Cod Cottages" are numerous and so delightful in their perfection of proportion and simplicity that I could never pass one without an exclamation of admiration. Many are shingled, unpainted, and weathered to the loveliest silver-gray tone. The doorways of even these little cottages are true in line and lovely in proportion; and their hollyhock-flanked stone steps lead directly to the soft green turf. Often the most charming little white-fenced gardens separate the houses from the street. The villages contain adequate town buildings, churches, and good libraries, all improved and increased in efficiency by the summer people, who are more and more finding "The Cape" a delightful place to spend a restful and interesting vacation. Many attractive modern residences are constantly being built, and many, also, of the old Cape houses and cottages purchased and equipped with modern conveniences.

In thinking of "The Cape" one envisages the long forearm, the bay and South Shore roadways and towns, the sand dunes, and the long seacoast. But there is a most interesting region in the interior of the broad portion, full of extensive pine woods and fresh-water lakes, the latter affording fine fishing and canoeing. This is a splendid place for camping, tramping, and tripping, with the double advantage of being near enough to civilization for one to end his trip at any minute.

Boating, naturally, of every sort; canoeing and paddling in the calm fresh-water lakes and smaller harbors and yachting, sailing, and motor-boating in the coast waters; one can select as safe—or as strenuous—water sports as he wishes.

Fishing, of course. The Cape is no longer a maritime settlement, as of old, but there are still plenty of fish and fishermen, and plenty of blue-fishing and deep-sea fishing.

There is no place in New England more interesting or varied for tramping and automobiling. In a word, one can here select his favorite occupation, sport, and diversion. He can go to the Cape as a hermit, camp in the deep woods, tramp on the lonely beaches and sand dunes, and enjoy nature in solitude. He can locate in a fashionable hotel, join yacht, golf, and tennis clubs, and motor, dance, bathe, and otherwise enjoy fashionable life, if he so desires.

Old-fashioned garden gate.

The Poverty Complex

By MARY WILLIS SHUEY

THEY have evolved a theory of poverty now. That is, the psychologists have analyzed it and labeled it, and dressed it up in all the new terms of repressions and I. Q's. But boiled down, it isn't anything startling after all, but just this:

People who *TALK* poor, and *LIVE* poor, and *THINK* poor are very apt to *STAY* poor.

We've known this before. Long ago I found out that some of our best families were poor, but that NICE people didn't *talk* about it, or even appear to *notice* it. (Of course I'm Southern, and had advantages that way, but other people are beginning to learn it now! We still dislike boasts of prosperity, but a success story succeeds ten times as well as a hard-luck tale.)

We laugh at the over-boastful, but we listen. But when it comes to the poor-mouthed we are slightly deaf. We just naturally don't care for poverty tales unless they are the prelude to success.

This dislike of the things that make up *POVERTY* is instinctive. If we did not dislike the props of poverty we would never bother to get away from them. There was a time when *POOR* and *HONEST* were considered synonyms, but that day is past. Proof of this is even in our present-day plays. No longer is virtue undeniably associated with rags!

Perhaps the theory of poverty is not literally true. It isn't a mental science formula, you know. Wealth is not attained by merely holding the thought! There really are people who accumulate money by living in a penny-pinching fashion, and thinking of themselves as on the road to the poorhouse.

But look at those around you. The people who have scrimped and cut corners for years—what happens when they have saved the amount of money they set as a goal? The habit of niggardly living, of thrift carried to excess, has become so fixed in many cases that they find it impossible to change to any great extent. Their THOUGHTS remain as poor as they were when they had to save, and it is an actual truth that it hurts them to spend.

Women are worse than men in that respect. This may be because the brunt of the saving usually falls on the women, or it may be because the men have known all the time that they really were not as poor as they lived!

But can't you see them—those old couples who have worked so hard, and saved so steadily, but who are utterly unable to enjoy the pleasure of spending, now that it is possible? Men who wear old clothes and have few amusements: women who drudge when it is unnecessary?

People like that really stay poor even if they have made money, for unless money changes our living or our outlook there is no benefit, and we might as well not have it.

On every hand we hear of the reckless, spendthrift habits of Americans, and never a soul tells us that SPENDING money is one way of MAKING money.

People who concentrate on the SAVING of money often fail in the MAKING of money. If a large part of surplus time and energy is devoted to figuring out ways to cut down expenses, to save in every possible way, there seems to be, in many cases, no increase in the earning power. "To live content with small means" may look well as a motto on the wall, but it is those who are NOT content with small means who force themselves to the larger opportunities.

I am not belittling saving. But saving, like everything else, should be in proportion to the income. We all need a reserve fund, and we need permanent savings of at least 10 per cent of our incomes—at least even-as-you-and-I people do. But if we start saving when we are young, 10 per cent is sufficient. If saving has been postponed we must increase the amount, for none of us wants to face a dependent old age.

It is only when we know that all our bills are paid, that we have nothing to worry about in a money way, and that we have a savings account that we can invest if the opportunity comes, that we can concentrate on other things.

There are two extremes. There are couples who do not take any savings seriously. They live from week to week, almost from day to day. If anything happens that is out of the ordinary they go to Mother's to live for a while.

Any couple that spends MORE than their income is on the wrong road. Billing and cooing are all right in their place—but the bills must be paid by the tenth of the month!

The majority of us are trying to live in proportion to our incomes. We want all the comforts possible and a few luxuries. There is nothing like a few absolutely unnecessary things to give us a feeling of well-being and self-respect! Pleasant living standards give us the ambition to earn more luxuries.

One reason that it does not do for us to THINK poor and TALK poor is that it is apt to produce an inferiority complex. Being poor does not make us inferior in any way. Didn't I just say that some of our best families are poor—BUT they do not emphasize it? The emphasis of poverty as a virtue just makes an excuse of never doing much! The men who have risen out of poverty never thought of themselves as belonging to the-poor-we-have-always-with-us.

Wealth? Poverty? It is all comparative, of course, and maybe Happiness is comparative, too. But while there may be no relation between money and happiness, there is a direct relation between freedom from financial worry and Happiness.

So SAVE—enough to do away with worry, and to provide for the future. But SPEND—enough to be happy! For it is the happy people who are most apt to succeed, and theirs is REAL success, no matter what happens.

Wages for Men Who Do Not Work

Has the "Dole" in Great Britain Been a Blessing or a Curse?

By JUDSON GRENELL

IT WAS the dole, or a revolution!

Thus it appeared to the upper and middle classes of Great Britain, in 1920—so a keen London observer told me as we lunched at the Liberal Club.

The business boom of 1919 had disappeared. Millions of working men and women were without employment. Other millions dependent upon them needed food, shelter and clothing. They were penniless, except for what was obtained through the uncertain channels of charity or the out-of-work insurance provided their members by some of the older labor organizations.

Occasional lootings of stores and supply depots had occurred. Something had to be done, and immediately, to relieve the situation. There was no telling to what extreme a starving populace might go.

Under these circumstances there was born in the British Parliament in August, 1920, the law that insured against absolute want certain classes in Great Britain. The law has in it echoes of German socialistic and Russian communistic psychology, combined with conversative beliefs stubbornly held by British organized labor.

This British unemployment law has since been amended at every session of Parliament, in the endeavor to get rid of its absurdities and make it more workable. It provides for the raising and distribution of certain funds. To this fund working men and women, employers and the government contribute. The funds collected are distributed through an army of government officials scattered all over the country, but naturally concentrated in the manufacturing districts. The collections are made and the doles distributed weekly. Another army of clerks is needed to keep the accounts straight and prevent fraud and duplications.

The word "dole," by which this unemployment insurance scheme is generally known, has the taint of charity. It is not so considered by those who enjoy its benefits. No more so, they insist, than any other insurance plan, the funds for which are mainly collected from the beneficiaries.

Today in England, Scotland, and Wales, and the northern part of Ireland,more than ten million men and women and a comparatively few boys and girls under 18 years of age each pay into the fund weekly from 8 to 18 cents. The employing class pays for each employe approximately the same amount a week. The general government provides from funds raised by taxation 25 per cent of the sum needed to pay the dole.

Collections and distributions run into the millions a week. Working men and women consider their contributions as a part of the cost of living, and demand wages sufficient to take care of them. Manufacturers add their contributions to the cost of their products. British goods are weighted with these additional costs, and to a certain extent exports are curtailed, unemployment is accentuated, and greater demands are made on the dole.

Can anyone imagine a more vicious circle of cause and effect?

The British unemployment law does not cover agricultural, horticultural or forestry activities. Neither does it include domestic service, except where the person is employed in trade or business carried on for the purpose of gain. It also excepts from its provisions the army, navy, and air forces, general and local government officials, policemen, those working for public utility corporations, tramways, railway and dock companies, and those in receipt of pensions.

It was the general opinion of those with whom I talked about the dole, that these exceptions were more likely to be lessened than extended, should the law be continued beyond June 30, 1926, when it expires by limitation. The law itself provides that the Minister of Labor may, with the consent of the treasury, include in the collection and distribution of the dole persons now employed in exempted industries.

The original law provided for a weekly dole equivalent in American money to $3.75 for men and $3 for women. No person was entitled to the dole for more than 15 weeks in any one insurance year. An amendment allows in some instances as much as the payment of 44 weeks' dole, though the general law restricts to 26 weeks. In March, 1921, the dole was increased to an equivalent of nearly $5 a week for men and $4 for women, but two months later it was reduced to the original figure of 15 shillings for men and 12 shillings for women.

Long before the law for insurance against unemployment was passed, a number of English trade unions took care of their unemployed members. They continue to do so, but the government reimburses them to the extent of the dole now provided by law. This is notably the case with the printers who have been paying out-of-work benefits since before the beginning of the present century.

As a matter of fact, the unemployment insurance law follows in many respects the program of the trade unions, to prevent fraud and discourage idleness.

The British unemployment law is a long-drawn-out document containing 18,000 to 20,000 words. Enacted as it was in haste, considering its importance, it lacks lucidity. Especially so, considering that it is supposed to be for the benefit of that class having the least understanding of legal verbiage.

It provides for many inspectors who may demand admission to factories, plants, and business places where men and women are employed. They are empowered to look over books and accounts, and interview employers and employes collectively or separately. Only private residences are barred to them, and not then if any kind of industrial activity is carried on therein.

The traveling and other expenses of the inspectors are paid from funds appropriated by Parliament for this purpose. And the expenses of and remuneration to insurance officers, courts of referees and umpires also come from this source.

Each insured person has a book in which are placed weekly the adhesive insurance stamps provided by the treasury. Provision is made for the replacement of the books when lost, mutilated or stolen; and there are severe penalties if the books are used for any other purpose than that provided by the law.

If the wage offered an unemployed person is less than that which has been habitually obtained in that particular district at that work, the unemployed person does not lose his or her right to the dole if the employment is refused. The same rule obtains if the wage offered is less than the union rate, or a rate offered by a "good" employer.

If an unemployed person is receiving outdoor relief, the dole will still be paid if the supplementary relief does not exceed ten shillings a week.

If a person has employment outside of his or her usual avocation, it does not affect the right to the dole, as an unemployed person, if the daily compensation for such employment is less than three shillings and fourpence. This is equivalent, at the present rate of exchange, to about 85 cents.

Strikes disqualify for the dole. Lockouts do not. If a strike is in only one branch of a manufacturing plant, then employes in the other branches, should the business be brought to a standstill, are to be treated as if the idle employes were in a different factory, and are entitled to receive the dole.

Many sections of the original law have been amended or repealed. This has confused those having the duty of enforcing the law. In consequence there are many contradictory decisions by referees, insurance inspectors, and umpires. The umpire is appointed by the king, and from his decision there is no appeal.

The dole law may have staved off a revolution. I do not know. Many believe that if its life is not continued, next year, it is likely to bring one on. No doubt can exist, however, that its present effect is to encourage idleness. Those who live off the dole are underfed, and starvation never makes one ambitious to work. Besides, it tempts a speculative element in the community—the betting class try to "beat the law," and obtain the dole in addition to other income.

Dealing as the law does with business relations between employers and employes, it interferes with the freedom of employers to hire and fire, and of employes to accept or decline employment.

The law lessens the supply of labor for temporary jobs. No one in receipt of the dole cares to take employment that promises to last only a day or two; it breaks in on his regular receipt of the dole. He has to start over again, to get on the dole pay roll.

"It doesn't pay to work a day," a recipient of the dole told me. He had turned down half a dozen chances of a day's or three days' work. With idle laborers all around them, employers are put to it, at times, to fill orders demanding immediate attention.

Some workers are obliged to pay into the dole fund, but are not allowed to take anything out. A woman told me this story. She worked every noon in a restaurant, her occupation being to slice the roasts. The employer was compelled to hold out of her wages not only the stipulated sum demanded of a fully employed person, but also to pay in himself an equal amount. A twist in the law did not allow the woman to receive the dole should she be unemployed. When not slicing roasts she eked out a living by running an apartment house

Another case brought to my attention was that of a man who had gone into business for himself. He kept at it a couple of years, and then drifted back into the class of wage earners. The law requires that he pay 20 weeks' dues before being entitled to the dole, whereas, had he continued as an employe of some establishment, he could have got on the dole after three days' idleness. Usually a wage earner must have paid 12 weeks' dues before his name can go on the unemployment roll.

There was a strike of engineers and firemen in the employ of a railway company. Because of stoppage of work, certain porters carrying goods from one yard to another were discharged. They demanded the dole while idle, but were refused by the Court of Referees. On appeal to the Insurance Officer, the decision of the court was reversed and the claim allowed.

A woman out of employment was offered a job such a distance from her home that she would have consumed four hours a day going and coming. She refused to take it, and was cut off from the dole. Then the Court of Referees allowed the dole. The Insurance Officer declined to accept the court's recommendation, insisting that the woman, who was a widow, with no children to care for, should have moved nearer the work offered her.

I heard the following case while sitting in the headquarters of an association interested in human welfare: A painter in Liverpool was out of work and living on the dole. He was informed of a probable job at Birkenhead, a short distance away, at standard wages, awaiting a competent man. The fare was five pence, which he said he didn't have. So he declined to apply for the job, but insisted that he continue to receive the dole. The Court of Referees upheld the painter's contention, but the Insurance Officer reversed the decision. It was his opinion that "a person on the dole ought to be forehanded enough to keep by him a sufficient sum to enable him to reach any place in his district where employment is offered."

An amusing case was that of a chambermaid who was offered work, provided she would take the next train to an adjoining city. This gave her only three hours to get ready. The position was refused claiming the notice was too short, but she said she could get ready to go the next day. On demand for her dole, the Court of Referees refused, claiming that even though the notice was short, still it was long enough. However, the Insurance Officer agreed with the chambermaid, and her dole was continued. "In the case of a woman," said the Insurance Officer, "giving her only three hours' notice to get ready to go to another city is too short a time."

One of the jokers in the original unemployment law was a provision that after a member 60 years old and over had paid 500 contributions, he was entitled to a refund of all he had paid, less the amount of doles received. Of course, the joker was at the expense of the treasury. This section was tinkered with in the endeavor to make it equitable, but finally it was repealed except to those who had become qualified as to age before last July.

"An artisan who has had the good luck to be employed for a long period," the Minister of Labor told the House of Commons, "has no right to dip into the fund to receive any balance that may remain to him, thus throwing a heavier burden on those who have had no such good fortune. The refund plan is contrary to the fundamental principles of insurance."

Many of the provisions of the law are as contrary to sound economic principles as this particular section was to the fundamental principles of insurance.

Since the law went into effect, as high as 1,200,000 men and women have been paid the weekly dole. Last autumn this number was reduced by a hundred thousand or so. Sometimes it is one trade, sometimes another, that leans most heavily on the dole fund. Last August 25 per cent of those engaged in shipbuilding were idle. Some 18 per cent of those depending on the shipping service were unemployed. Certain kinds of mining was slack. At the same time trade was brisk in tin plate and sheet steel, silk, jute, carpet, and brick trades.

Altogether the unemployed, compared to the number registered, was a trifle less than 10 per cent. These figures have varied very little since. Twelve hundred thousand paying into the dole, 1,100,000 drawing the money out.

It is calculated that unemployment insurance is costing the British public not less than $200,000,000 a year. One quarter of this comes directly from the government treasury, incomes bearing the greater part of the burden.

The dole law was passed by a combination of Liberal and Labor party votes in Parliament. This was before the Labor party had its brief inning governing the British Empire. Since then there has been an election, and the Conservative party has a clear majority over the opposition.

Unless the law is given another lease of life, it dies June 30, 1926, as before stated. If business is booming on that date, the opinion is that its demise will be grudgingly accepted by the wage-receiving class.

Parliament Building, Westminster, London.

Mr. Ford's Page

THE flying generation appears to have arrived. Its pioneers came some years ago and got through with the elementary preparations, but now the main body of the air people is coming into sight. The song of the airplane is heard in the land, the skyside of the clouds becomes familiar to an increasing number of folk, and a new era of transportation is undoubtedly in view.

It is not a mere figure of speech to speak of the flying generation, for it is not the presence of the airplane that creates the fliers, but the fliers who create the generation. Each generation seems to come to do its special work in realizing man's ancient patent of dominion. The order in which that dominion is expressed in Holy Writ is, first, the Sea; second, the Air; third, the Earth. The sea was sailed because a generation came which had an urge toward the sea. The air is sailed because there has come a generation with an urge toward the air. It is not a question of making flyers of the old generation; it is merely a question of the new generation developing the genius and the desires that it brought with it.

There may be a hidden truth in this arrangement of Sea, Air and Earth, in man's patent of dominion. It may be that we shall not know the potency of earth until we have explored the air, our last regional field of exploration. Then we may return equipped to find new secrets in the earth. Certainly the forces of the sea have not been guessed as yet. The Gulf Stream itself furnishes in half a day, in the form of heat, more power than all humanity uses in a day. We have not harnessed the potency of the sea. And as to the earth, we are just beginning to find the atom out of which it is made. It is still early morning, a dewy, fresh and promising morning, for mankind.

The new playground opened for man's faculties is the Air. It is a perfectly natural development. Timorous souls hang back and shake their heads in warning that we are "going too fast." But it is obvious that those who say that are not. Those who are geared to the gait of the generation do not complain of the speed. It is a case of "slow moving traffic keep close to the curb"; there are others on the road. The pace is not too fast for those whose pace it is. The generation of fliers having arrived, they fly. It is as natural as the transition from the stagecoach to the locomotive, or from the one horse chaise to the motor car. And it is a serious question whether these modern improvements do not, after all, lessen the strain on men rather than increase it.

WHEN Tennyson had his vision of "Locksley Hall" eighty-three years ago, he saw the airplane in a marvelous light. Poetry and prophecy became one. Vision is not only foresight but insight, and though prophets may prophesy, it requires seers—men who see what to do—to bring the vision to pass upon the plane of actuality. Tennyson saw the airplane as somehow connected with world peace. It was after he saw "airy navies grappling in the central blue" that the war drum ceased to throb in the world and "the common sense of most" became the rule of all. Evidently power in the right hands has something to do with imposing peace on the world. Compulsory peace will be necessary in some quarters to give the peace habit a chance to form. And the airplane may become a powerful instrument to the end.

Flying, which has begun as a thrilling amusement, will follow the line of natural development and become an economic asset; but perhaps its greatest immediate importance is in its relation to the peace of the world. If the poet was a prophet, too, the advent of the airplane as a military asset precedes the establishment of peace and the Federation of the World.

It was 83 years ago that Tennyson, in his "Locksley Hall,"

" dipped into the future, far as human eye could see,
Saw the Vision of the world, and all the wonder that would be!

"Saw the heavens fill with commerce, argosies of magic sails,
Pilots of the purple twilight, dropping down with costly bales;

"Heard the heavens fill with shouting, and there rained a ghastly dew
From the nations' airy navies grappling in the central blue;

. . . . . .

"Till the war drum throbbed no longer and the battle flags were furled
In the Parliament of Man, the Federation of the World."

Poetry and prophecy grow on the same stem, and this surely was prophecy. Tennyson foresaw by nearly a century what has actually come to pass in the mechanical world, and if his foresight was as true for the world of politics, the outlook is good.

If it be not pressing the poet's words too far, it would seem that his vision of peace includes a struggle which must occur first. There was shouting in the heavens, aerial navies grappling, and then the war drum ceased and mankind met in parliament and the world was federated. Some would doubtless say that the struggle has occurred, and that we are now in the days of the Parliament and the Federation.

That, however, is by no means certain. World peace is always a possibility when men want it, but experience teaches that no amount of parliaments will create a situation which men do not want. There are as yet too many interests in the world whose only hope is war and confusion, and, what is worse, there is a great amount of ignorance on the part of those who desire peace as to the methods of those who desire war. The peace elements of the world are easily scared off from their militant desire for peace. One of the first steps toward peace is to call the names of those who profit by war and who therefore desire war. But this is precisely the thing which the peaceful elements of the world refuse to do, they are so fearful of being charged with "racial prejudice."

Peace will not begin in this world through the nations having attained a peaceable disposition. To expect that the people of certain racial elements are going to create in themselves a belief in peace, is to expect what does not occur. But to expect that the idea of peace shall enlist such powerful allies as that peace shall be imposed as a compulsory condition, to which all nations by long use shall become accustomed, is quite reasonable. In such a way peace will come to the world—it will be imposed.

It may be that the airplane will be one of the means to that end. It is not in a League of Nations, with all the nations sitting around that the spirit or practice of peace will be born, but in the alliance of those peaceable nations that are powerful enough to impose peace on the world.

Tennyson saw the airplane as a harbinger of world peace; he saw the peace that follows; but he saw something else equally important; he saw the differing degrees of progress which mark the various ages and the various groups of races:

"Not in vain the distance beacons. Forward, forward let us range;
Let the great world spin forever down the ringing grooves of change.

"Through the shadow of the globe we sweep into the younger day;
Better fifty years of Europe than a cycle of Cathay."

And better five years of America than fifty years of Europe. Ideas attain universal dissemination now almost the same day. What formerly it required years to make known to the few, is now made known to all as rapidly as radio and telegraph and daily printing press can handle it. There are more facts to work with, they are more truly related and interpreted, decisions are more scientifically based than ever before, so that the rate of accomplishment in the mental and moral spheres is as high as in the mechanical sphere. We ought to have more time than any other generation that preceded us because, for one thing, we know more what to do with time than our forbears did, and, for another, we save more time than they used. And the airplane, instead of being an end in itself, is only the outward sign and symbol of an inward, invisible lift.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Make Way for America!

SAID a citizen of a leading American metropolis the other day:

"In our city there are two Polish papers, two Italian papers, two Hungarian papers, one German, one Belgian, and several of other national groups, even one in the Syrian language. These papers all sound forth distinct national and racial notes. The only nationality not represented in the newspapers of our city is the American.

"Of course our city has papers in the English language. Of course, the staff of any of them is largely made up of native-born Americans. But these English-language newspapers do not sound forth a distinctly nationalistic American note. When it comes to utterances of old-fashioned patriotism there is a reserve and a restraint which is not found when these papers in other languages praise their racial or ancestral institutions."

Isn't it true? Americans have somehow been effectually shamed and silenced with reference to their country. Papers and persons seem afraid of patriotic expression lest they be charged with "waving the flag" or "making the eagle scream." It seems that in our time you can wave any flag except the American Flag. You can cheer any national air and be extolled for love of country, but if you take your hat off to the Star Spangled Banner you must expect to be called a sentimentalist or a jingo. A time may come in this country when those who do honor the American Flag will be allowed to show that reverence, as well as those who have taken a mad fancy to the flag of Sovietism or the standard of Angora. But just at present, under the drum-fire directed against everything American, most people seem a little dazed in their sense of country.

Once in the early years of colonization in America the French claimed all the land on one side of a certain river, the English all on the other. Thereupon certain Indian tribes sent to their white neighbors the query: "Is there no land for the Indians in the Indians' land?" The time seems to have come to ask whether more room shall not be found for American nationalism among the nationalisms in America, and more room for the American Flag to wave in the free skies which it made free.

Business

JOSEPHUS DANIELS says that the United States is ruled by three men—Andrew Mellon, Herbert C. Hoover, and William B. Butler. And these, he says, spell Big Business. It may be, however, that Mr. Daniels is heaping too much honor on these three. It may be true that they have power—many small and inconsequential men have had power—but it is not at all certain that they can use the power that might be theirs. To which one would the description of "ruler" apply? Which one possesses power enough to get himself elected to office by the vote of the people? Which one of them can operate, save in a very limited sphere, without being checked? No, Mr. Daniels pays them the tribute of too much fear.

But what he says about Big Business causes every lover of free government to prick up the ear. No one who knows the history of recent years has any illusions as to what Big Business is likely to do if it gets control of the government. Not that Business is badness; not that Bigness is badness; but simply because so much of present-day Big Business is Big not by growth but by artificial combination, and is Business in the manipulative rather than in the creative sense. The passage from a period when politicians thought it their highest advantage to swat all business and hinder it, to an Administration frankly committed to give business its due honor and opportunity, is necessarily fraught with danger. The danger arises from the fact that not all American business is on the basis of service. The old idea still rules in many lines, as patches of snow in some secluded spot defy the April sun. There is, of course, no evidence that Mr. Mellon or Mr. Butler are new era business men. Mr. Hoover talks about it a little, but has scarcely demonstrated it. To that extent Mr. Daniels may be justified in saying that it is old era business that is in the saddle. And to the extent that this is true, danger exists.

The outcome depends on Mr. Coolidge. If he sees the essential difference between new era business principles and old era ones, and is not misled by the bald plea of "business," there is reasonable expectation of avoiding the danger. It was in the confidence that Mr. Coolidge is able and willing to do this that he was elected. But it is certain that a committal of government power to men who are motivated by the old idea of mulcting the public and of charging all the traffic will bear, is not going to help the country and would seriously injure the Administration. This is the point for the President to watch. Criticisms like that of Mr. Daniels will not compel agreement unless it should become evident that Washington has slumped back into the old rut.

In this connection attention may be called to a series of articles which begins in THE DEARBORN INDEPENDENT this week on the connection between business and government. The author, Huston Thompson, chairman of the Federal Trade Commission, knows what he is talking about.

The Grain Market

TUESDAY, March 17, will be long remembered by thousands who dabbled in grain futures and were sold out by brokers. A wholesale default in margin assessments occurred in the face of a heavy slump in quotations.

To economists who have been pointing to speculative prices for grain at a time farmers had none to sell as an evidence of agricultural prosperity, this should be a lesson not to confound gambling with business.

In a time of more active foreign demand than usual the day witnessed a drop in grain prices of 14 cents the bushel for wheat, a total drop of 57 cents since the slump began, with a proportionate recession in other grains.

This is reported to emphasize the warning which we have given before, namely, that it is the height of absurdity to assume that speculative prices form an index to business conditions. The artificial flare in prices was disastrous in that it was used to conjure the feeling that the agricultural problem was solved and everything could be allowed to run wild again.

The Boss Blames Himself

"AGITATORS" had arrived in a certain town and "unrest" had developed. Nothing actually had "happened" but employers were nervous. At a dinner attended by "bosses" one night John Edgerton, president of the National Association of Manufacturers, was slated for a speech. He "spoke out of church" about as follows:

"I own a little woolen mill down in Tennessee. If I were to go to my plant some morning and find that an agitator had come in overnight and turned all my workmen against me and that they had all walked out on a strike, I wouldn't worry about trying to find out who the agitator was, or where he came from. I'd take myself off into a back room somewhere and go into executive session to see what was wrong with ME.

"I wouldn't blame agitators: I'd face facts and recognize that this strike was MY fault. In my mind I'd think of it like this: 'Why, these people have known me for ten or fifteen years, and if some stranger can come into this little town and turn them against me in a few hours, there must be something the matter with me. I had lost their confidence or he couldn't have moved them against me.'

"I always figure that you never have to go very far from home to find the cause of most of your troubles."

We read the other day that last year's strike toll was only a little more than half a billion dollars; while in the seven years preceding, industrial warfare was said to have cost nine billion. It may mean that we are getting more leaders on both sides with sense enough to start hunting the cause of trouble under their own hats.

Radio Jars Tin Pan Alley

"TIN PAN ALLEY" probably has been on Barnum's side of the fence, believing one is born every minute. One even suspects that Tin Pan Alley follows the long-haired unknown who invented the application of the word moron to the whole human race.

Most of us trail with that better judge of humanity who said you can't fool everybody all the time; and most of us find that the despised "average man" is a pretty clever fellow after all.

But Tin Pan Alley is very sophisticated, and knows its way about. So it embraced radio with open arms and a chuckle up its sleeve; for here was a new chance to "plug" its songs and make us buy.

But time passed and Tin Pan Alley had another thought: This new giant vehicle of entertainment was stealing—no less. For broadcasting constituted "publication," a form of publication which yielded the song writer no money.

More time passed, and T. P. A. now has a third thought—and such a sad thought, for many. The public doesn't belong to the "one a minute" class at all; and use of the word "moron" merely blinds the eye of the user so that he cannot see the average man as he is. Songs of cheap sentiment and tinsel tunes have met a plague. They shrivel and die, and their lifeless bodies fairly clutter up New York's music zone.

Four hundred and fifty broadcasting stations repeat alleged song hits over and over again. The public sickens and will not buy. Poverty stalks Tin Pan Alley, at the elbow of the clever jingler—he who has dexterity without talent. A weekly theatrical journal publishes a list of names of erstwhile prominent song writers who have gone back to the occupations they followed before easy money came their way. Many are selling neckties again.

John Phillip Sousa once told us that the sole test of good music is that good music is something you want to hear again and again. Millions of alleged "morons" are proving him right. Publishers say that good music never had such a sale as it has had since radio gave the "average" man a chance to make comparisons and take his pick.

Tin Pan Alley seems to have met the human race.

The Boomerang

IT IS now clear that the entire Republican organization, from President Coolidge down, acquiesced in the puerile punishment of Republicans who criticized the party. A party which was already defeated on its record, and saved only by the interposition of Mr. Coolidge's personality, forgot to walk humbly and thank God; it reared itself in boisterous and somewhat brutal pride upon its victory, showing its unrepentant nature by turning to rend honest men who said with words what the country would have said with votes had not drastic events intervened. At first there was some doubt how far this action was representative. Now there is no doubt.

The opinion of THE DEARBORN INDEPENDENT about it all has been expressed before and need not be repeated here. There is only one misunderstanding to be guarded against: the concern of this paper is not for the men thus partisanly punished. That is not the point at all. If tomorrow they could be forced back into the positions to which they are entitled in the organization of Congress, that would not alter the situation in the least. The country can spare the services of these men, just as it could spare the services of all the men in Washington today. The point is that a party with unparalleled opportunity before it should in the face of solemn duty exhibit the puny spirit which has defiled all Congressional action since. It is not the deed that matters, but the spirit that could conceive it. Victors, with the mandate of the country upon them, found it not only easy but natural and gratifying to turn to paltry deeds of most ungenerous personal vengeance. That is the disheartening thing. But it is not the worst. To be sure, it will prove a four-year boomerang to the Republicans, but that is not the worst. It will be a constantly recurring obstacle to that proper public service which we have a right to expect from the Congress. This single act will lay a train of events which will cause many a regret and precipitate many a deplorable situation before it is finally expiated. It is a great pity. Everything might have been started off with so much more wisdom.

The Flight of Lincoln's Assassins

On the Trail of J. Wilkes Booth and David E. Herold—Third Article

By F. L. BLACK

"VENGEANCE!" was the cry of Washington and the North on Saturday, April 15, 1865, when the word sped abroad that Lincoln was dead. Where had the assassins hidden? Who aided them? The terror-stricken Capitol city was made still gloomier by a heavy rain. It was rumored that there was a great conspiracy headed by Jeff Davis and his colleagues to murder all the officials of the Union Government. The wildest tales were easily believed, reason fled, and chaos reigned.

The first attempt at organization for the pursuit and capture was a special commission of three colonels formed in the early morning hours to start an investigation. Hundreds of soldiers, policemen, and detectives were put on guard by the War Department at all possible avenues of escape. The Navy sent warships to patrol the Potomac and prevent the flight of the assassins by water. Other than the crossing of the Navy Yard bridge, no trace could be found of the direction which Booth and Herold had taken, although it was surmised they had gone toward lower Maryland and the Potomac.

On Sunday $30,000 reward was offered for the capture of the fugitives. This was increased to $100,000 by the War Department and handbill descriptions of Booth, Herold, Payne, and John Surratt were posted.

"Booth," said the handbill, "is 5 feet 7 or 8 inches high, slender build, high forehead, black hair, black eyes, and wore a heavy black moustache, which there is some reason to believe has been shaved off."

In the meantime, where were the assassins? At the conspiracy trial Polk Gardiner testified that on the night of the fourteenth of April, he was on the Bryantown road, coming to Washington, and about 11 o'clock, when on Good Hope Hill, he met two horsemen, one about half a mile behind the other, and both riding very fast. The first, who was on a dark horse, asked if a horseman had passed ahead; he also asked the road to Marlborough, and if it did not turn to the right. Gardiner told him no; to keep the straight road.

As the second horseman rode up, a number of teamsters were passing and the witness heard him ask them whether a horseman had passed ahead. He rode a light horse of a roan or an iron-gray color.

According to John Lloyd, keeper of the Surratt Tavern, ten miles from Washington, on Friday at midnight, Booth and Herold rode up to the front door. Herold dismounted and entering asked for the weapons which had been left by them five or six weeks before. Booth did not enter and refused to take his carbine, saying that his leg was broken. In addition to a carbine, Herold was given a field glass left by Mrs. Surratt that afternoon and a bottle of whisky from which he first drank then took it out to Booth. As they were leaving Herold boastingly claimed, "I am pretty certain we have assassinated the President and Secretary Seward." Then both were off on the road toward the village of T. B.

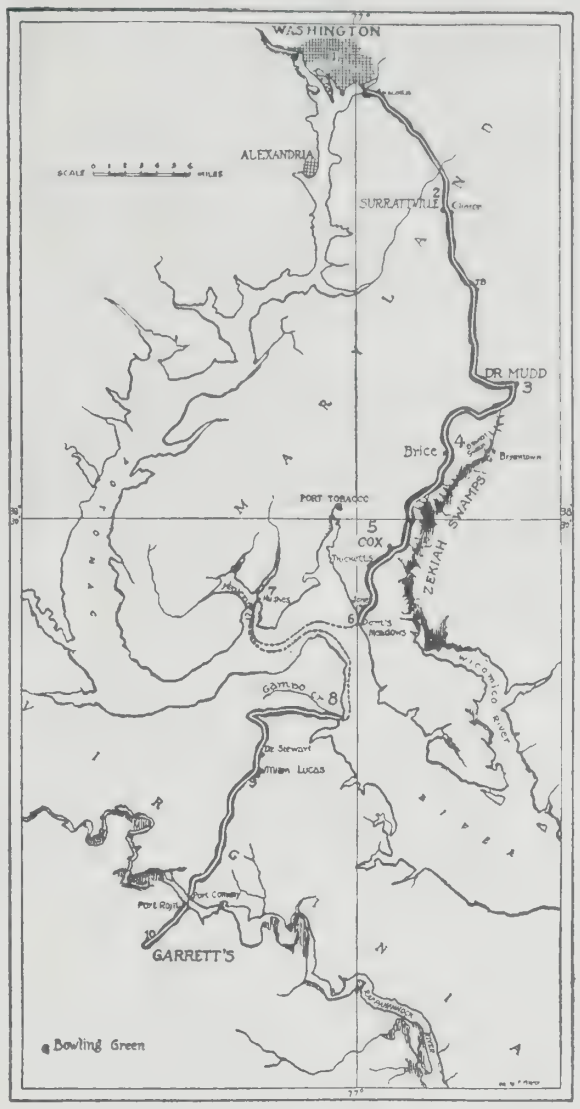
With a fracture, what was more natural than that Booth should seek medical assistance from one he felt could be trusted—Dr. Samuel Mudd, a rebel sympathizer, whom he had met the previous autumn. Arriving at the home of Doctor Mudd about daybreak on Saturday morning, Herold rapped at the door while Booth remained mounted. Doctor Mudd opened the door and with the aid of Herold helped Booth off his horse and into the house. Placing him on a sofa, the doctor, according to his own story, split the leg of his boot down to the instep, slipped it off and the sock with it. He then felt carefully with both hands down along the leg, and found that it was fractured near the ankle. He then improvised out of pasteboard a sort of boot that adhered close enough to the leg to keep it rigidly straight below the knee. A low-cut shoe was substituted for the leather boot. Colonel H. H. Wells testified that, in an interview the week after the assassination, Doctor Mudd told him he had examined Booth's leg and found that the front bone was broken, nearly at right angles, about two inches above the instep. It seemed in his (Doctor Mudd's) judgment as slight a breaking as it could possibly be.

Procuring the doctor's razor, Booth shaved off his mustache and going upstairs, he and Herold remained until between 3 and 4 o'clock that afternoon when the nearness of evening made it seem safer to venture forth.

On the following Friday the boot removed from Booth's broken leg was given to Federal detectives and placed in evidence at the trial. Inside the leg of the boot were found the words, "J. Wilkes." It was a long riding boot, for the *left* foot, slit up the front for about eight inches, and can be found today in the secret archives of the War Department among other mementoes of the assassination.

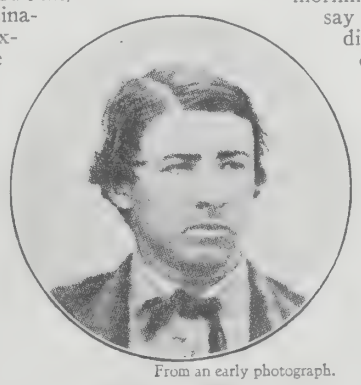
Booth and Herold lost their way near Brice Chapel and finding a Negro, Oswald Swann, hired him to lead them to Rich Hill, the house of Samuel Cox, a southern sympathizer, where they arrived early Saturday morning. This was on the edge of the Zakiah Swamp, several miles south of Doctor Mudd's. Cox, afraid to take them in, hid them in the thickets near the swamp and sent for his foster-brother, Thomas J. Jones, who has told his story in a book, "John Wilkes Booth," from which we quote:

"It was a little after nine o'clock when we reached Rich Hill. Cox met me at the gate and we walked off a short distance to an open space where there was nothing that might conceal a listener. At length he said to me: 'Tom, I had visitors about 4 o'clock this morning.' 'Who were they, and what did they want?' I asked. 'They want to get across the river,' said Cox, answering my last question first; and then added in a whisper, 'Have you heard that Lincoln was killed Friday night?' I said,



Route taken by fugitives.

1. Ford's Theater, 10:20 p. m., April 14. 2. Surrattville; midnight, April 14. 3. Dr. Mudd's, 4 a. m. to 4 p. m., April 15. 4. Near Brice's, lost; Herold goes to Oswell Swann's and takes him for a guide. 5. Reaches Cox and is placed by him in "the thicket," a. m., April 16; remains there to p. m. April 21. 6. Dent's Meadows, put in boat by Jones to cross river, p. m., April 21. 7. Miss their bearings in the darkness and enter Nanjemoy Creek and stop near Colonel John J. Hughes', April 22. 8. Cross river and leave boat at bridge Gambo Creek, a. m., April 23. 9. Stop overnight in cabin of William Lucas, April 23. 10. Cross ferry at Port Conway and arrive at Garrett's barn, April 24. Captured and shot 2:30 a. m., April 26.



From an early photograph.
DAVID E. HEROLD

'Yes, I have heard it,' and then told him of my interview with the two soldiers the evening before. When I had finished there was silence between us for a minute, which was broken by Cox.

"'Tom, we must get those men who were here this morning across the river.' He then went on to say that about 4 o'clock that morning he was disturbed by a knocking at the door. On opening the door he found a strange man standing there, while waiting at the gate was another stranger on horseback accompanied by a Negro man of the neighborhood, named Oswald Swann. He went out to the man on horseback, who, upon being satisfied that it was Samuel Cox he addressed, took him a little apart, out of hearing of the Negro, and told him what he had done. He showed him in India ink upon his wrist the initials of J. W. B. He told Cox that he knew he (Cox) was a southern sympathizer who had worked for the Confederacy and that he threw himself upon his mercy. He explained how he had broken his leg and thereby been prevented from reaching the river that fateful Friday night. All this Cox told me, speaking almost in a whisper, standing near his gate that bright Easter morn.

"'Sam,' I replied, 'I will see what I can do, but the odds are against me. I must see these men; where are they?'

"He then told me that he had sent them to a place in a thick piece of pine about one mile to the west of his house—his overseer, Franklin Robey, guided them to the spot, with the promise that he would send someone to them; and had advised them to remain perfectly quiet. He agreed with them upon a signal by which they might know the man who came to them was from him. This signal was a peculiar whistle which I do not remember now. He also provided them with food for the day, and I believe, though I am not sure, with a pair of blankets.

"'Take care how you approach them, Tom,' Cox said to me as I was leaving. 'They are fully armed and might shoot you through mistake.'

"I left Cox and rode toward the spot he had indicated. As I drew near the hiding place I saw a bay mare, with saddle and bridle on, grazing in a small open space where a clearing had been made for a tobacco bed. I at first thought that she belonged to someone in the neighborhood and had got away. I caught her and tied her to a tree. I then went on a little farther until I thought I was near the place indicated by Cox. I stopped and gave the whistle. Presently a young man—he looked scarcely more than a boy—came cautiously out of the thicket and stood before me. He carried a carbine ready cocked in his hands.

"'Who are you, and what do you want?' he demanded. 'I come from Cox,' I replied; 'he told me I would find you here. I am a friend; you have nothing to fear from me.'

"He looked searchingly at me for a moment and then said, 'Follow me,' and led the way for about thirty yards into the thick undergrowth to where his companion was lying. 'This friend comes from Captain Cox,' he said; and that was my introduction to John Wilkes Booth. He was lying on the ground with his head supported on his hand. His carbine, pistols, and knife were close beside him. A blanket was drawn partly over him. His slouch hat and crutch were lying by him. He was dressed in dark—I think black—clothes; and though they were travel-stained, his appearance was respectable.

"I told Booth that I would do what I could to help him; but for the present he must remain where he was; that it would not do to stir during the hue and cry then being made in the neighborhood. I promised to bring him food every day, and to get him across the river, if possible, just as soon as it would not be suicidal to make the attempt.

"He held out his hand and thanked me. He told me, as he had told Cox, that he had killed President Lincoln. He said he knew the United States Government would use every means in its power to secure his capture. 'But,' he added, with a flash of determination lighting up his dark eye, 'John Wilkes Booth will never be taken alive'; and as I looked at him, I believed him.

"He seemed very desirous to know what the world thought of his deed, and asked me to bring him some newspapers.

"Wednesday and Thursday passed uneventfully. The neighborhood was filled with cavalrymen and detectives. They visited my house several times during that week (as they did every house in Southern Maryland) and, upon one occasion, searched it. They also interviewed my colored man, Henry Woodland, and threatened him with dire penalties if he did not tell all he knew. Henry did not know anything because I had told him nothing. I took no one into my confidence.

"On Friday evening, one week after the assassination, I rode down to Allen's Fresh. I think I had been there every day Booth had been under my care, except the Tuesday I went to Port Tobacco.

"Allen's Fresh, about three miles east of my house, was and still is, a small village situated where Zakiah Swamp ends and the Wicomico River begins.

"I had not been long in the village when a body of cavalry, guided by a man from St. Mary's County, named John R. Walton, rode in and dismounted. Some of the soldiers entered Colton's store, where I was sitting, and called for something to drink. Soon afterward Walton came in and exclaimed, 'Boys, I have news that they have been seen in St. Mary's,' whereupon they all hastily remounted their horses and galloped off across the bridge in the direction of St. Mary's County. I was confident there were no other soldiers in the neighborhood. 'Now or never,' I thought, 'is my chance.' I waited a few minutes so as not to excite suspicion by leaving immediately after the soldiers, then mounted my horse and rode slowly out of the village.

"As soon as I was well out of the village, I put whip to my horse and rode rapidly toward the spot where the man who was that night to test his fate was lying. It was dark by the time I reached the place. I had never before visited the fugitives at night; I, therefore, approached with more than usual caution and gave the signal. Herold answered me and led the way to Booth. I informed them of what had just occurred at Allen's

The Surratt Tavern as it looks today.

Money Birds of Prey

Victims of Fake Stock Artists Lose Over Half a Billion Dollars a Year

By GEORGE GARRETT DE MORE

This is the second of a series of articles dealing with the methods of stock swindlers.

THE people of the United States are losing between $500,000,000 and $1,000,000,000 annually to the apostles of "get-rich-quick"—the financial parasites operating behind the cloak of inadequate laws to fleece the ignorant and the foolish.

The pirates' nest in the Texas and Oklahoma oil fields are cleaned out and a few offenders punished and the rest immediately flock North to resume operations in radio, motor, bond and mortgage, and other ventures—certain to yield "one hundred to one thousand per cent on the investment in a few weeks." One-half billion dollars in Liberty bonds were taken in exchange for fake securities in the space of a few months in western states and still the appetites of these financial parasites are craving for additional plunder.

At only one other period in the history of the world has a nation been abused by unscrupulous promoters as the American nation is today, and that was in the time of the Mississippi Bubble in France and the South Sea Bubble in England—these periods of wild speculation overlapping each other and coming to disastrous ends within a few months of each other.

There is marked similarity between the two periods, as a list of frauds in England in 1720 compared with present-day schemes in the United States will show. England today is free from the unscrupulous promoter, through the operation of the English Companies Act. There is no national law in America similar to this statute or one adequate to cope with the situation.

How slow the nation has been to realize the evils brought about by the clever swindler is best shown by the fact that no state had a blue-sky law until in 1911, when Kansas passed a statute regulating the sale of securities.

The country then began to take notice of the heavy toll the financial parasite was taking of the national income, and in the years 1912 and 1913 twenty-two similar statutes were passed in other states. By the end of 1921 there were thirty-seven states with blue-sky laws.

But the fake stock artist employed crafty lawyers to attack these laws, and when test cases were carried to higher courts the worst offenders escaped with small fines or scot-free under the interpretation that blue-sky legislation as written was unconstitutional.

Even states with well-defined laws regulating the sale of securities have difficulty in curbing the activity of the fake stock promoter and his dupes. Only a national campaign and national legislation can save to the country for legitimate enterprise the billions that are now being dissipated. When the fake promoter can no longer hide behind the commerce clause of the Federal Constitution and realizes that a prison sentence instead of a fine awaits him, he will be more careful in his operations.

The speculative instinct in the United States has had no such example as was presented to the French and English nations early in the eighteenth century—examples which are taught in the histories of the schools of these nations. Here in the United States but little is known of the Mississippi and South Sea Company bubbles. In contrasting the past with the present I will present a short sketch of that period of frenzied speculation.

The Mississippi Bubble was originated by John Law, a Scotsman, who after killing an opponent in a duel in England escaped to France and settled there. He became the intimate of Phillippe of Orleans who became Regent of France upon the death of Louis XIV.

The finances of France were in a deplorable condition. The people groaned under the weight of taxation and were rightfully indignant at the corrupt manner in which these levies were laid and collected.

John Law offered to pay off the public debt through the creation of a company to trade in the Americas. His proposition was gladly received by the Regent, who was too weak to take the drastic steps necessary to place the country on a firm financial basis.

Speculation in the shares of the Mississippi Company began immediately. Soon the whole country was involved, for John Law made it appear that the company would soon be so wealthy that it would pay off the entire national debt.

He received a charter from the Regent to found a bank and issue paper money, and soon his notes were commanding a premium over gold. This bank was later incorporated into the Royal Bank of France, and the financial control of the French nation was in the hands of this Scotsman.

Speculation in the shares of his company became a mania. They increased in value to more than a thousand per cent. From the highest to the lowest the nation was interested. Noblewomen used every form of subterfuge to gain admittance to Law's banking house and be placed on his list of subscribers to a new issue of shares.

As the bubble continued to expand every ingenious device was used to prevent its collapse. Its shares were manipulated by stockbrokers and the most impossible stories of the wealth the company had discovered in America were circulated.

But the shrewd money-lenders knew a reckoning was at hand and sold out. This started a run on Law's bank. Payments were limited to a few pieces of gold at a time, but the run continued and finally all transactions in gold were prohibited and a person discovered with any large amount of the precious metal in his possession was brought to court.

Such extreme measures only exaggerated the conditions, and the result was an impoverished nation and a disillusioned people.

In 1711, Harley, Earl of Oxford, secured a charter to trade in the South Seas. The company struggled along for a number of years and played but little part in the nation's finances. Finally Great Britain faced a condition where it could not pay the interest on the national debt.

The Earl of Oxford devised a scheme similar to John Law's by which his South Sea Company would assume the liability. On January 22, 1720, two proposals were made to Parliament regarding the debt, one by the bubble organization and one by the Bank of England. Parliament indorsed the proposition of the South Sea Company.

When at a later date an inquiry was begun it was disclosed that certain members of the legislative body had accepted bribes in the form of stock, which proves that the alliance between the politically corrupt and the financial oligarchy in control of a country was made at an early date.

There were "leaks" in those days as at present, and while Parliament was considering the proposal the shares of the South Sea Company increased two to three hundred per cent in value, an indication the stock-jobbers knew which way the wind blew.

Speculation now became universal. The shares were eagerly bid for and mounted higher and higher. The disease afflicted the entire nation.

But your Englishman is more ingenious in finance than your Frenchman, and did not stop at the South Sea Company, but formed hundreds of other speculative enterprises, in which, in the space of a few months, more than 1,500,000 pounds sterling was won and lost.

It was of this period that Daniel Defoe wrote:

> "Some in clandestine companies combine;
> Erect new stocks to trade beyond the line;
> With air and empty names beguile the town,
> And raise new credits first, then cry 'em down;
> Divide the empty nothing into shares,
> And set the crowd together by the ears."

It was a remarkable period in British history and drove home a lesson your Briton has never forgotten. If you were to ask him to invest in a concern to manufacture a combination of chocolate and cod liver oil, as the American public was recently asked, he would refuse with a sophisticated twinkle of the eye. He has heard all about these "get-rich-quick" companies. But the American public sank several million dollars in a company, which originated when the promoter, so he alleged, heard two girls in the subway converse regarding the horrid taste of cod liver oil, except when taken with a piece of chocolate.

Your Englishman learned all about fake swindle companies in 1720 when hundreds of them were originated. The two prize schemes of the time, which we can parallel right here in the United States, was "Puckle's Machine for discharging round and square cannon balls and making a total revolution of the art of war," and "a company to carry on an undertaking of great advantage, but nobody to know what it is; capital, 500,000 pounds; shares 100 pounds each and two pounds deposit." As you may guess, in this later instance the investor never learned what the enterprise was, for the promoter disappeared. Styles in the art of swindle change, and there are fake companies today which place as great a strain on the imagination as these two.

Here is a list of others, which on July 12, 1720, in England, were declared illegal:

The Merchants & Traders Whale-fishery in Greenland; Joseph Galendo, praying a patent to cure and prepare Virginia tobacco for the making of snuff according to his secret formula; Captain Machpredis, praying a charter permitting the raising of a sum of money for purchase of lands thereon to be planted and reaped a wood called madder for use of dyers; for Assuring Seaman's Wages (just imagine what a sailor would have left after having his wages discounted by the sharpers of Exchange Alley); a Grand Dispensary (capitalized at three million pounds); a company Insuring all Masters and Mistresses against theft by Servants; for Carrying on a Trade in the River "Oronooko"; for Buying and Fitting out Ships to Suppress Pirates; for the Transforming of Quicksilver into a Malleable Fine Metal; for Colonization of Acadia; for Trading in Hair; for Furnishing Funerals to any part of England.

The complete list comprises eighty-six bubble companies with a total capitalization of more than 300,000,000 pounds sterling. Eight were to engage in coal, iron or lead mining and a half-dozen in fishing, which demonstrates how the fake promoter seizes on legitimate enterprises to foster swindles.

The financial parasites change their schemes each year, but their principles are the same—they trade on fallacies of finance; the idea that one can become independently wealthy through the purchase of any kind of stock waved before him by the swindler. Wall Street has an eagle eye for speculations paying 100 per cent. The promoter does not have to seek the man with a few hundred dollars. Remember, this is the "jazz-age" in stock selling.

A Remedy (?) for Campaign Fund Evils

By BURT M. M'CONNELL

THE revelation by Senator Borah's committee that Republican campaign expenditures in 1924 were four times those of the Democrats, who also spent four times as much as the Progressives, comes rather late. Such information would have been interesting last October, when Senator La Follette was raising the cry of political corruption and charging the Republicans with having raised a huge "slush fund" to control the election. But with the next campaign almost four years off, the Borah report on the "slush fund" investigation is of little except academic interest. Or, rather, it would be had it not raised the question of the propriety of collecting campaign funds in one state for use in another.

That, it will be recalled, was the basis of the La Follette charge. Millions were being raised in New York, Pennsylvania, and Illinois to "buy up the West." This myth is exploded by the Borah report. The total received by the Republican National Committee was but $4,360,478.82, whereas it spent $8,100,739 to elect President Harding.

The Coolidge election was not bought. True, a huge campaign fund was raised by Pennsylvania manufacturers to be spent in other states, and this created the impression that money can, and sometimes does, frustrate the will of the voters. But the day when a state could be bought is past. The outright purchase of half a million votes could not possibly be accomplished in secret. "Slush fund" charges are a political trick; often they are a two-edged sword. And almost always they are a barometer of impending defeat. The candidate who knows he is on solid ground makes no reply to such charges.

Campaign funds, if they are used for the proper information and education of the voters, are not harmful. A political campaign in such a large country as the United States costs money. There is the office rent for headquarters to be paid; the salaries of the campaign employes; postal, telegraph, and traveling expenses; the printing of books, pamphlets, circulars, and lithographs. For political conditions may arise when it is necessary to carry on a legitimate campaign of education; the voting public must be informed on certain issues. Bogus pledges must be exposed by speakers or literature; the spotlight must be turned on an opponent who has gained a strategic advantage by appealing to the ignorance of his constituents; attacks upon the Constitution or the Supreme Court must be fought, and the only way to fight and expose these campaign tactics is by a speaking campaign throughout the country. And this requires hundreds of thousands of dollars in railroad fares alone. No; the chief trouble with campaign contributions is this: The dollars contributed to the losing party are stainless; those dropped into the bulging coffers of the winning party are "tainted."

Senator Borah, in his report, condemns the practice of collecting large funds in certain states and sending them to other states to be used in the presidential campaign, on the ground that this may lead to evil and corrupt practices. He apparently overlooks the fact that corrupt practice acts and the purity of elections are matters for the state's consideration, and not that of Congress.

The committee's suggestion, if adopted, would prevent the free interchange of argument and ideas throughout the country. This would encourage the blight of sectionalism. In the last analysis, it would prohibit a candidate for the Presidency from making a campaign outside of his own state. Instead of having two national parties, we would have ninety-six state parties—one Democratic and one Republican in each state. Instead of having a national election, we would have forty-eight state elections. This would please the La Follette followers, who were defeated last autumn in their plan to trim the claws of the Supreme Court, by campaign funds raised in the wealthy states of the East and Central West and sent into the region where the campaign against the Supreme Court was flourishing.

The American citizen, wherever he may reside, is first of all an American. When he contributes to the campaign fund of his party, he does not stipulate that the money be spent in his own state. The doctrine of state's rights cannot properly be applied to presidential campaigns. Besides, this plan to keep campaign funds at home would be sure to evolve another species of bootlegger—a bootlegger of campaign funds. And no one save those on the "inside" would know how the funds were juggled.

The Major's Golf Score

THE Major was playing in a scoring competition, and took the Short-Hole-Going-Out in three actual strokes, but his partner and marker set down fifteen on the card. The Major's tee shot placed the ball in a bunker, where it lay hanging with a gorse branch close behind it. The Major lifted the gorse branch and took up his stance. Immediately the ball began to roll down the slight slope. The Major then accidentally grounded his club, and had a go at it while it was in motion, and hit it out of bounds beyond the green. On its way to the forbidden area the ball struck his clubs which he had laid on the green, and also glanced off the pin, which, though less than twenty yards away, he had not removed. He dropped another ball in the bunker, and deftly holed it at his next stroke. He was penalized two strokes for lifting a loose impediment in a hazard, two for grounding his club, one because his ball moved after he had taken his stance, two for striking at a moving ball, two for hitting his clubs, two more for hitting the pin, and one, in addition to the distance, for playing his ball out of bounds. We are glad to learn that the Major's vocabulary triumphed over the cumulative strain imposed upon it.—*Morning Post.*

Insects That Act as Lady Bountiful

Luscious Fruits, Costly Silks, Wax and Honey Are Among Their Gifts

By WILLIAM ATHERTON DU PUY

A TINY insect of the Mediterranean has made the United States an out-and-out present of a considerable industry, the Smyrna fig industry, which yields thousands of tons of choice dried fruit every year and places it there in the corner grocery where anybody may buy.

It used to be that these choice figs would not ripen in the United States. The trees would grow but would not bear fruit. Why they would not was for a long time a mystery. The trees grew lusty and strong in California but the little figs, putting out in the spring, would grow until they were as big as the tip of your thumb, would shrivel up and fall off. Ordinary figs would ripen but not these big fellows that were so incomparably superior.

Scientists, knowing that insects have much to do with the well-being of many plants, suspected that there was a lack in California of some helper to the fig that existed in Turkey. The United States Government, therefore, sent a technical man to the Mediterranean with instructions to find out what aid to production existed in the orchards of the Near East that was not present in those of California.

Back of Smyrna, the tragic city which the Turks burned some three years ago, at the time of the flight of the Greeks, is the valley of the River Meles, harboring a civilization so old that it was here that Homer wrote the Odyssey. In the fig groves of this valley the American observer found the natives hanging garlands of wild figs strung on bits of fiber. These wild figs, he found, grew in the country roundabout. They were dwarfed little things of no use as food.

Investigation showed that these dwarf figs contained many tiny insects. Soon the insects issued from them and immediately thereafter they might be seen crawling into the holes at the ends of the young Smyrna figs thereabout. Put a tobacco bag over one of these little figs so the insects could not visit it and it would dry up and drop off just as did those in California.

The result of the investigation was that it was shown that these insects fertilized the figs and thus made it possible that they might grow to maturity. They carried pollen from the wild fig to the domesticated fig. Oddly these two dissimilar figs are mates. Unless the pollen from the one gets into the flower of the other (a fig is a flower turned inside out) the fruit will not ripen. This tiny insect, a member of the wasp family, carries the pollen. Where it does not exist Smyrna figs cannot ripen.

Getting these insects to California and establishing them there was a four-year task for even so resourceful a person as Uncle Sam. There was such a short time for a trip from Turkey to California between the time the egg was laid to the time the mature insect died of old age. Finally the race was won and insects ready to lay eggs in Smyrna figs were turned loose in the orchards of the Pacific Coast. Immediately figs began to stick on the trees and ripen. Soon the insects were numerous. All the figs stuck on. They have been sticking ever since. If the fig insects should go on strike this spring, however, not a single Smyrna fig in all California would mature.

Quite a different rôle was played by the ladybird beetle that, some years ago, saved the orange crop of the United States. We had oranges, but plague was upon them. The orange trees were being done to death.

It was back in the nineties that the plague arrived. It came from Australia and stole in on imported orange trees. It was in the form of tiny mites, which ran about the orange trees, so small that they could hardly be seen. When the mother insects matured their legs dropped off, so they had to settle down. They drilled into the bark of the tree until they struck the sap stream and thereafter sat tight and drank sap. Then, for protection for the young they intended to raise, they built houses. These houses were made of a peculiar frothy, wax-like substance that came out of their bodies. When there were many mothers close together making these houses, one merged into the other and the surface of the tree was covered with them. So arranged they became a "scale." Because of the appearance that they made when piled up in this way they were called the "cottony cushion scale." When there were enough of these insects with their bills inserted and drinking sap there was none of it left to nourish the tree. It died for lack of food. They were so numerous at one time in California that all the orchards were sick near to death.

Something had to be done. Scientists were hurried to Australia, the native home of the cottony cushion scale, to find out why it did not kill the orange trees over there. Here was another riddle to be solved with the existence of an important industry as the stake.

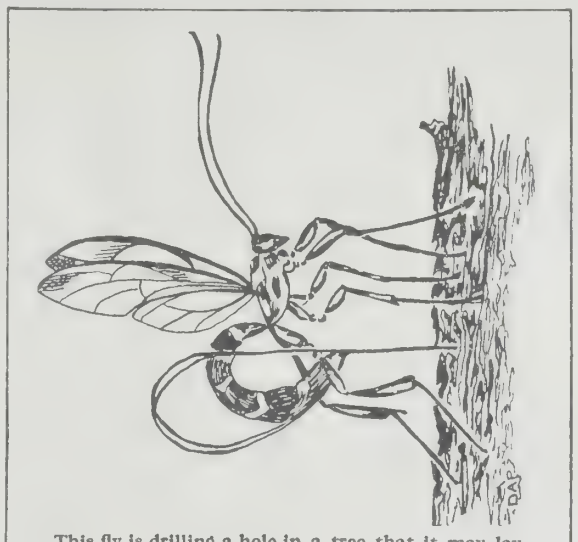
In Australia it was found that this scale was policed by a very efficient insect officer, and kept within bounds. There was one peculiar ladybird beetle, as big as a shoe button and looking like a tiny turtle with bright red spots on her back, that devoted herself exclusively to the orange plague. When it got troublesome she ate it into subjugation. When it was scarce she went on short rations. The moment it began to get over-plentiful, however, the ladybirds began raising huge families and these devoured the scale.

Obviously the thing to do was to bring these ladybird beetles to California and start them eating. They were introduced, were released in the orchards. There they found unlimited quantities of their special food. With their appetite satiated each ladybird sat down and laid 300 eggs. In a few days each had 150 daughters, each laying 300 eggs. Then the granddaughters got busy and the great-granddaughters. One mother might have a billion descendants in a few months. As a matter of fact all the orchards of California were full of them within a year, the scale was eaten up, and the orange crop saved.

Down at Sacramento the State of California maintains a reserve army of ladybird beetles. Enough of them are always there to form the basis for the creation of an eating corps that is competent to cope with any emergency. France, Cuba, Florida, many communities, have called for help and received it. California will whip any cottony cushion scale outbreak in the world just for the fun of doing it.

Beetles generally are enemies to man and this ladybird is a beetle. The potato bug and the boll weevil, for instance, are beetles. They are enemies of man, while the ladybird is his good friend. So is her little cousin in America, so much like her that they can scarcely be told apart, of whom the children sing: "Ladybug, Ladybug, fly away home." This ladybug is also a scale eater and helps save many kinds of fruit trees.

Twelve queer-looking little foreigners arrived recently at Portland, Oregon. They were gathered in England and shipped from France in medicated cotton in



This fly is drilling a hole in a tree that it may lay an egg that will hatch a larva that will devour a borer that is injuring this bit of timber.

a box within a box. They are the progenitors of swarms and swarms of their kind that are to be cultivated and raised in Portland during the summer months.

Each little arrival looks like a smut-stained grain of wheat and is about that size. Each one is contained in a small gelatine capsule, such as a druggist uses to mask some evil-tasting dosage.

Each one is a tachinid fly, the parasite that lives and breeds on and within the earwig and with which the city plans to fight the earwig menace this summer. It is through the activity of the tachinid fly, according to the records, that the earwig pest is kept within control in the Western European countries where climatic conditions are favorable to the development of the earwig, as they are in the Pacific Northwest.

The only feasible way of transmitting the parasites for such a long distance was to send them in the pupa or chrysalis stage.

The tachinid prospers only with the earwig as a host and there is no danger that it will itself become a pest.

The shipment was prepared and dispatched under the direction of United States entomologists abroad working with similar agents of England and France.

The United States is not always an importer but sometimes an exporter of insects. There is the case, for instance, of the bumblebees that were sent to the Philippines, there to play Lady Bountiful to these wards of Uncle Sam.

When the United States first took over those islands it wanted to do the natives every good turn it could, so, for one thing, it sent over some red clover and had its representatives plant it. Clover, it figured, would be of great benefit to the Filipinos.

The clover grew nicely but failed to make any seed. It was all right for that patch but when time for reseeding came, or for planting new areas, more seed had to be brought over from America. The clover crop could make no progress on that basis.

The Department of Agriculture knew that only bumblebees can fertilize red clover, can carry the pollen from one flower to the other. Ordinary bees do not have bills that are long enough to reach to the drop of honey that is in the bottom of the red clover cup. They know this so waste no time visiting red clover blossoms. They are left to the bumblebees.

There were no bumblebees in the Philippines so the government undertook to send some over. To do this an odd trick was played on them. Colonies of them were put into refrigerators and thus led to believe that it was wintertime. They went into hybernation, set their alarm clocks for waking them up when springtime should come. So they traveled halfway around the world, were allowed to thaw out, started thrifty generations of bumblebees and gave a brand new crop to this corner of the world.

It is a quite different type of service which those mercenaries, the ichneumon flies, render to man. They are among the most valiant fighters that he may array in his cause when he is attacked by other insects as, for instance, the caterpillar of the gypsy moth that has done such damage to the trees of New England. These ichneumon flies are tiny, slim, wasp-like creatures, very seldom seen. They look quite frail and harmless but are, in fact, fiends incarnate. Their favorite amusement is to tip down at some fat and sluggish caterpillar and deposit eggs on him or inside him. These eggs bide their time but in the end they hatch out and the resulting grubs begin eating from within. Sometimes there are scores of them in a single caterpillar. Eventually the caterpillar will die but the young gormands keep on eating. Caterpillar meat, dead or alive, is all one to them. When they finally begin to emerge the carcass of the caterpillar seems to be decorated with hundreds of pegs that are sticking from it.

For nearly fifty years now the caterpillars of the gyspy moth have been threatening the very existence of the trees of New England. The forces of state and national government have, during all that time, been trying various expedients to hold the gypsy moth in check. Just now it would seem the tide is turning and this destructive pest is finally defeated. It is defeated largely because of the activities of the ichneumon fly and allied insects which operate much as it does.

There are such insects that lay their eggs on leaves where they are eaten by caterpillars and hatch out inside them. There are others that lay their eggs within the eggs of the gypsy moth, which is the mother of the caterpillars, there to hatch out and devour the egg. Each of these insects that wars on other insects has, in fact, its own method. There is, for example, one called by the fancy name of *Thalessa lunator*, which makes victims of certain wood-boring larvae, which greatly injure timber. *Thalessa* may listen on the trunk of a tree till she hears one of these borers at work within. Then she produces a tiny auger, slimmer than a hair, with which she drills a hole into the tunnel that the borer is digging. There she deposits an egg which hatches out into a grub that pursues the borer, fastens itself upon him, and does him to death.

It has now been 6,000 years since the Chinese found that cloth might be made from the cocoons spun by the caterpillars that lived on their mulberry trees. They began making this cloth before Italy, Greece, even Egypt itself, began emerging from barbarism. The silkworm was one of the first of Nature's creatures to become a domestic animal. Throughout the centuries that have intervened, the Chinese have bred this moth and worm in such a way as to make them fit always more perfectly into the purposes for which they are intended.

The moth, mother of the silkworm, is a helpless little thing that never moves more than an inch or two from the spot where she emerged from the cocoon. There, on a sheet of muslin, she lays her eggs and dies. The silk farmers gather these eggs and put them away, against the coming of the season when the mulberry leaves will again put forth, or ship them about the world to be hatched in many lands. They hatch when exposed to warmth and the young ones are fed mulberry leaves until they wax strong and energetically spin cocoons for themselves from which they expect to emerge full-grown, winged moths. Having done this, however, the poor things are run through ovens and roasted alive.

Then the cocoons are put in water for softening. The loose thread of each is found and attached to a reel which causes the half a mile of fiber on it to unwind just as might a spool of thread. It takes 3,000 of these cocoons to produce a pound of silk, yet there are so many of them reared in this world each year, to be offered up as sacrifices to man's desire for fine raiment, that about 100,000,000 pounds of silk is produced.

Of all the Lady Bountiful insects which work in the interest of man, however, it is probably true that the honeybee renders him the greatest service, yet a service which is little understood by those who benefit from it. People view the busy hives of the bee and the procession of workers that come and go, their boots full of honey. They eat the neat squares of their product and may give thanks to the bee for furnishing them. They consider that here their obligation to the bee has ended.

They do not realize that, if it were not for the bee, there would be in all the world no apples, nor pears, nor peaches, nor cherries, nor any other fruit from the flowering trees. Just as the fig insect was necessary to the Smyrna fig industry, and the bumblebee was indispensable to the red clover, so is the presence of the honeybee absolutely required if flowering fruit trees are to be productive.

This interdependence between bees and plants is one of the miracles of Nature. Each tiny flower seems to realize that it cannot set seed unless it can devise a means of getting pollen from another flower which is its mate. This pollen, the dainty dust which the flower carries in its heart, must find a messenger to serve its purpose. It realizes that to get service it must pay for it and therefore prepares the fee for its messengers. It knows that the available messengers, these ever-present, buzzing bees, are inordinately fond of honey. It, therefore, prepares a honey fee for them if they will bring it pollen. It puts a drop of honey in the bottom of its cup and the bee comes in for breakfast. This bee has already been to other blossoms and they have sprinkled pollen on its fuzzy head. Some of this is shaken off in the new flower, while yet other particles are gathered from it. Thus in going from flower to flower the bees mix the pollen from one with that of the other. Thus is the flower fertilized and thus is it made possible that it shall come to fruitage.

The honey crop of the whole United States amounts to seven or eight million dollars in a year. The apple crop of the State of New York, one of a score of the fruits from blossoming trees, amounts to as much. So is it shown that the bee is the sponsor for one whole group of food products of inestimable value to man.

The Way to Farm Profits

By ROBERT STEWART,
UNIVERSITY OF NEVADA.

THE successful business man maintains his profits by constantly striving to reduce the cost of production and also by the efficient merchandising of his product.

He attempts to reduce the cost of production by efficient management in the economic control of the factors of production and by the elimination of waste, not only the waste of material but also of time and labor.

Likewise, the successful farmer of today is maintaining profits by the efficient control of the factors of production and as far as possible by the elimination of waste in marketing.

Under the present system of marketing farm products the individual farmer is limited in his efforts to reduce the selling cost of farm products and any reforms attempted in this direction must come largely by united group effort on the part of those producing any given farm commodity.

Any progress made along these lines, to be of value, will be of slow growth. While better methods of marketing farm products are being evolved the individual farmer fortunately can help himself very materially by carefully considering methods whereby the cost of production may be economically reduced.

While various co-operative marketing methods have been proposed, some good and many bad, no suggestions have been made for the co-operative production of farm products.

Production always has been and probably always will be an individual matter. The individual farmer must, therefore, consider methods whereby his own costs of production may be lowered. This problem is largely within his own control and it is by individual efficient production that the farmer will largely solve his own economic problems.

It is a well-known truth, for example, that the productive capacity of the soil has an important bearing on farm profits. A farmer who has a fertile farm is more prosperous than one who is trying to make a living on a soil of poor productive quality.

There is an unfortunate false conception in the minds of many farmers that it does not pay to raise large crops since bumper crops mean *low* prices. It is true that *a uniformly* large crop of any commodity depresses prices but the individual farmer's problem is so to control factors of production as to produce his individual large crop at low cost of production and thus produce a profit for himself.

Some important facts in this respect have been established by the many farm management surveys made throughout the country and if they are correctly used, important conclusions may be made by the individual farmer which will be of value in controlling his own profits.

The following results obtained from Farm Management Surveys in Kentucky, Oregon, and Missouri are very significant:

Effect of Crop Yields on the Farmer's Labor Income

Crop Index	Labor Income
Kentucky	
90 or less	217
91—100	519
101—110	701
111—120	1080
Over 120	1150
Oregon	
91 or less	653
92—106	1085
Over 107	1596
Missouri	
60 or less	105
61—75	128
76—90	473
91—110	601
111—130	857
Over 130	908

These results indicate in a very marked way the value of large crops in increasing the farmer's labor income over the average of his neighborhood. A 30 per cent increase in crop index in Kentucky increases the labor income by $886. A 16 per cent increase in the crop index in Oregon increases the labor income by $943, while a 70 per cent increase in the crop index in Missouri increases the labor income by $805.

It is quite evident from this data that it does pay the individual farmer to produce large crops on his own individual farm as compared with the average of his section. The farmer who is producing better yields than the average is making money from his farm. It is important, therefore, for him to pay the most careful attention to his soil as a very material factor affecting his income.

Some very instructive data emphasizing this has recently been obtained in Texas showing the influence of increased yields on the reduction of the bushel cost of producing corn:

Effect of Crop Yields Upon the Cost of Producing Corn

Yield an Acre	Cost a Bushel
20 bushels	$0.94
21—30 "	0.53
31 bushels or more	0.45

It is clearly evident that an increase in yield of 50 per cent has decreased the cost of production by more than 52 per cent.

The cost of plowing, harrowing, disking, and the cultivation of corn is practically the same no matter whether the yield is twenty bushels or eighty bushels an acre.

If this cost is uniformly $5 an acre and it costs five cents a bushel to harvest and market the corn, nine cents a bushel to restore the fertility of the soil, and one-half per cent for taxes, and money is worth five per cent, then land which produces only twenty bushels of corn an acre is worth only $40 an acre with corn selling for fifty cents a bushel.

How much is land worth which will produce forty bushels an acre? It is worth not $80, but $171 an acre, land producing sixty bushels is worth $320, land producing eighty bushels of corn is worth $433, and land producing one hundred bushels of corn is worth $563!

That is, good land producing one hundred bushels of corn an acre will pay $5 an acre for producing the crop, $5 for harvesting and marketing the crop, $9 for the return of the fertility, $2.50 an acre for taxes and will pay five per cent interest in a land valuation of $563 with corn selling for only fifty cents a bushel.

The average yield of corn in the United States in 1923 was 29.3 bushels an acre. The average farm price in 1923 was 72.7 and the acre value, $21.33!

With corn at this price and the average yield only 29.3 bushels an acre the individual efficient farmer has it within his power to increase his individual production in an economic manner so as to make a handsome profit in producing corn. How can the farmer control the factors of production so as to increase his yields?

A study of conditions where the factors of production have been under economic control will indicate the results which the efficient farmer may reasonably expect to receive under similar controlled conditions.

The oldest experimental field in America was established in 1879 at the University of Illinois in the heart of the corn belt on typical brown silt loam soil.

The yield of corn on this field has varied from 28.3 bushels an acre to 57.2 bushels an acre depending upon the economic control exerted upon some of the factors of crop production, as indicated below for the period 1908-1917!

Soil Treatment	Corn Only	Corn and Oats	Corn, Oats and Clover
None	28.3	37.6	40.7
Fertilized	43.6	59.7	57.2

One plot has grown corn continuously since 1879, a second plot has grown corn and oats, while a third plot has grown corn, oats and clover; one-half of each plot has been well fertilized while the other half has received no soil treatment.

The plot in continuous corn without soil treatment has yielded 28.3 bushels an acre which compares very favorably with the average yield of 29.3 for the whole country recorded in 1923. The plot which has received full fertilizer treatment and has grown a rotation of corn, oats, and clover has produced 57.2 bushels of corn, a difference of 28.9 bushels of corn an acre for the full treatment!

Has this increase of 28.9 bushels been obtained in an economic manner? The rotation practiced in corn, oats, and clover is one well adapted to the corn belt. It is, therefore, extremely practical.

The fertilizer treatment consists of the utilization of the crop residues, including the growing of a legume catch crop with the oats. Manure has been applied in proportion to the amounts which would actually be produced by the crop grown when they are fed to livestock, that is, for every ton of produce a ton of manure has been returned to the soil. Finely ground limestone was applied once in 1904 at the rate of 1,700 pounds an acre and bone phosphate has been applied at the rate of 200 pounds an acre a year.

The actual cost an acre a year of the soil treatment has been: Limestone, $0.53, with ground limestone at $5 a ton; bone phosphate, $3.

The extra yield of 28.9 bushels of corn would produce 1,725 pounds of manure containing 8.5 pounds of nitrogen, 1.7 pounds of phosphorous, and 8.5 pounds of potassium, having a commercial value of $2.30 which must be added to the cost of production for soil treatment, making a total cost for soil treatment of $5.83.

The yield of corn, however, has actually been doubled. The acre value of the crop produced on the fully fertilized plot is worth $41.55 instead of $21.33 for the entire United States and the cost of the soil treatment to bring about this result has been actually only $5.83.

The average corn land in the United States in 1923 paid $5 for producing the crop, $1.47 for harvesting and marketing it, $2.10 for the return of soil fertility, $1.16 for taxes, and 5 per cent interest on a land valuation of $232 an acre.

The fully treated plot on the Illinois farm has paid $5 for producing the crop, $2.86 for harvesting and marketing it, $5.15 for the return of soil fertility, $2.60 for taxes and has paid 5 per cent interest on a land valuation of $519 an acre or has produced $25.95 an acre for the payment of the use of the farmer's time and capital!

The point of this story is that the progressive farmer to make money must produce better than the average results. Of the two big problems confronting the American farmer, reduction of his production cost and successful marketing of his products, the former is an individual problem and must be solved entirely by individual effort.

In the production of any farm commodity the farmer must produce better than the average of his neighborhood. The farmer who is content with average yield and average results will not be able to make money over a series of years. During times of under produce and high prices he will make money, ordinarily he will "just get by," while during times of stress he will go under. During an agricultural depression, such as has prevailed during the past four years, his commodity produced without profit to himself will simply add to the overproduction and thus assist in reducing the prices paid to the producers in general.

The successful farmer must produce better crops than the average so as to reduce his production cost. He will do this by using better seed, better methods of cultivation, better soil treatment than the average farmer uses.

He will produce larger yields an acre of high-quality crops produced at a low unit cost of production by more intelligent study of the controllable factors entering into the cost of producing crops such as the use of better seed, and far greater attention to soil fertility problems.

The Dressing of a King

AS A BOY, I was always a little excited when I read some such statement as this in books of European history: "The Duc de — — was admitted to a Royal *Lever* where the favor he sought was granted." What the exact nature of the function was I did not know, but I imagined a scene of grandeur, with the Personage on a throne, with courtiers in silks and satins advancing to the Royal Presence, with music and bowings and a glitter of lights—something very fine and noble and beautiful—the supplicant central making his plea in the hearing of all, then retiring backward in pleasant triumph at having gained his point.

The exact meaning of the Royal *Lever* did not come to me until I read the account given by Saint-Simon in his *État de la France*, 1687, and then it came as a complete surprise. For the *Lever*, to speak brute truth, was nothing more than a bedroom scene. At 8:30, the King was awakened by his First Valet de Chambre, a duke, who "gently pulled the coverlet" much in the same way, I suppose, as does a Pullman porter. Then entered the room the privileged ones, first the Duc de Bullion who was Great Chamberlain, then the Chief Gentlemen of the Bed Chamber, next the Grand Master of the Wardrobe followed by his subordinates and the Chief Valets de Chambre. With twelve in the bedroom the door was closed and taken charge of by a Chief Usher. All later comers had to announce their presence by "scratching softly and gently on the side of the door," for to knock would have been considered violent and unseemly. So scratched for admittance, in order, the King's Physician, the Queen's Physician, the King's Nurse, and, one by one, the admitted favorites whose presence had been arranged for the day previous. Among those favorites were such as had favors to ask or petitions to present, and these advanced to the bedside at an appointed signal, each one separately, while all others betook themselves to corners, and "looked discreetly at the walls or elsewhere."

Such was the function of the *Lever*, but the petitioners having had their favors granted or refused, were permitted to stand aside and view the rest of the ceremony. Stepping from the bed the King crossed himself and recited the Office of the Order of the Holy Ghost, which being done the Duke who held the office of First Valet de Chambre presented the slippers, which were put on the royal feet by the subordinate valets. Then the Great Chamberlain advanced with the dressing gown while two Gentlemen of the Bedchamber brought forward a chair in which the King sat to have his hair dressed. This ceremony was slightly changed on alternate days when the King was shaved. During the hairdressing or the shaving there came forward four private secretaries, three more valets, two readers, two controllers of the plate, the physician in ordinary, the apothecary and a few favored courtiers. Next came dukes and peers who had been waiting in the antechamber, marshals and household officials, officers and statesmen and the general court. It was resolute flunkeyism *in excelsis*. Apparently everyone clung nervously to the traditions, and while the crowd stood in solemn dignity, the dressing of the King was proceeding. There is no mention of bathing or of washing, but other things are described with meticulous care. With open-mouthed awe, those new to the function saw the adjusting of the wig, the pulling on of the breeches to which the stockings were attached, then the eating of a preliminary breakfast. Then came the taking off of the dressing gown and the presentation of the shirt. The bottomless folly of that last business was extraordinary. The right sleeve was held up by the First Valet de Chambre, the left sleeve by his immediate inferior. The Master of the Wardrobe adjusted the garment. So followed the garbing in satin, the hanging of the blue ribbon, the buckling of the sword, the fastening of the cravat, the adjusting of the hat and plume and the handing of the cane, each and every piece of business being done by a properly appointed official. The last office was the bringing forward of four handkerchiefs by four individuals, and then the choosing of one, and so the morning ceremony ended.

—From a Busy Man's Notebook.
—C. J. F.

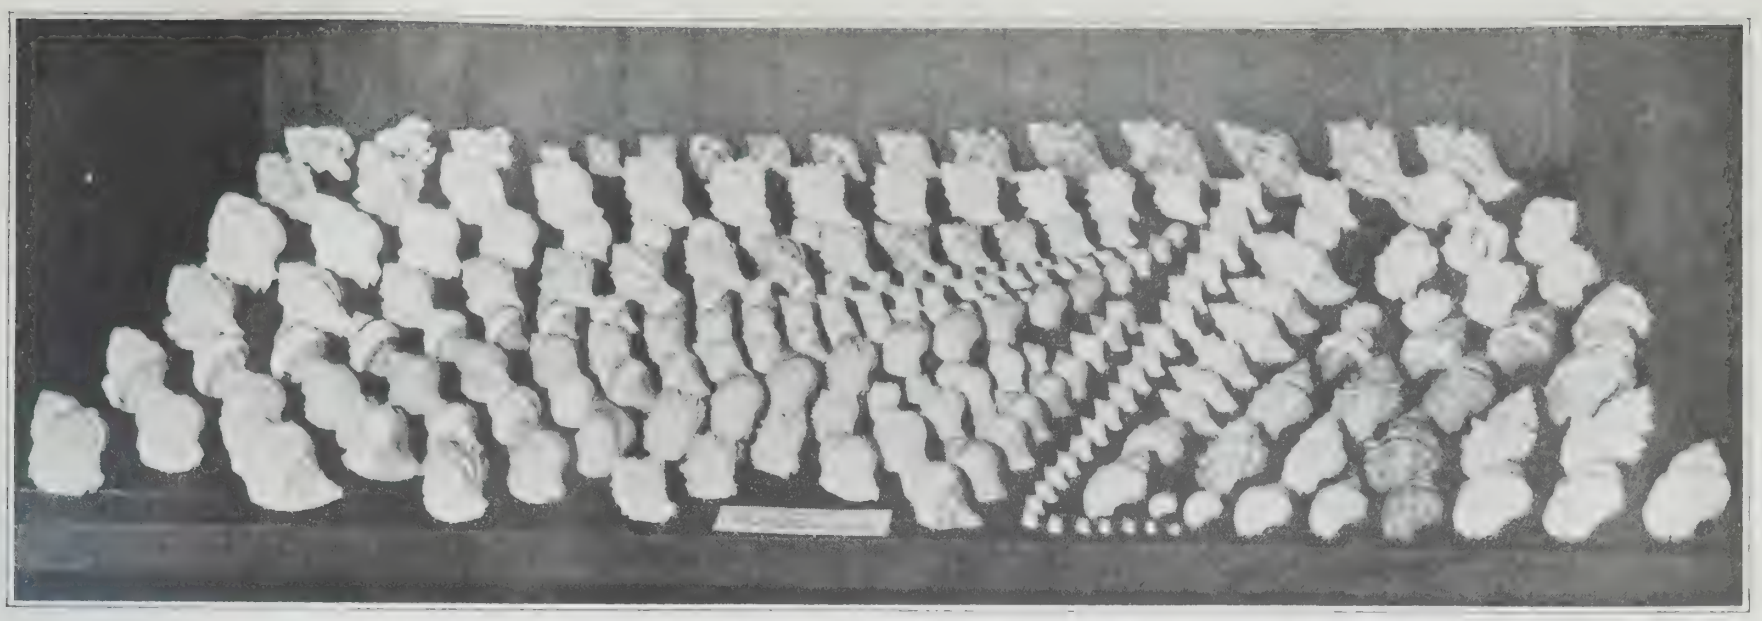
When Smoking Was Illegal

The following is taken from the court booke of Methwold, Norfolk, under date of October 4th, 1695.

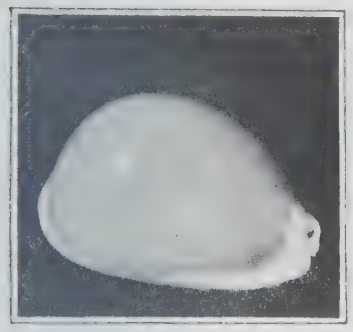
"Wee agree that any person that is taken smoaking tobacco in the street shall forfitt one shilling for every time so taken and itt shall be lawfull for the petty constables to distraine for the same to be putt to the uses of the towne."

A few pages further there is the record of the first arrest under the tobacco prohibition law.

"We present Nicholas Barber for smoakeing in the street and do amerce him one shilling."



This photograph of a single kind of shell, depicting all the steps from infancy to maturity, gives an idea of the extent of the Golish Shell Collection.

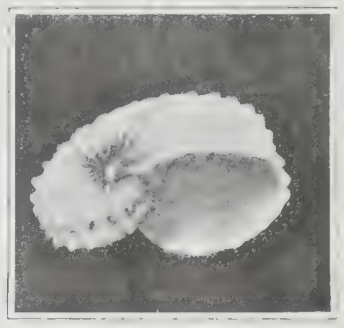


A shell of wondrous golden color, this particular specimen of *cyprae aurautium* is one of the rarest of shells.

Gems of the Ocean

Mr. and Mrs. Golish's Collection of Rare and Beautiful Sea Shells

By HENRIETTE BOECKMANN



In Catalina Island's waters dwell the rare and remarkable *argonantidae*, or paper sailors, the lovely house being built by the female herself.

TO THE average man the amassing of an uneclipsed collection of shells must mean a lifetime of the most painstaking effort and persistence. To the erudite it signifies all that and much more. A single tiny shell found on a remote island or a thousand miles inland ofttimes tells more on its unwritten surface of both geology and ethnology than might be read in a volume in any library. For these reasons the great Golish collection of shells on display in the Southwest Museum of Los Angeles places the mark of its compilers, Mr. and Mrs. W. H. Golish, far above that attained during the lifetime of the average person.

And yet neither of these ardent collectors had more than the average school education. It was from a shell shop at a beach town in Southern California which Mr. Golish once owned, that this vast assemblage of shells grew as infant to the maturity of its present proportions that give equal rank with the two largest conchology collections in the East.

Moreover, by reason of its display features the Golish collection stands distinctly in a class of its own. Students and collectors from all parts of the world have been attracted to this collection by reason, chiefly, of its unexcelled methods of display.

It has been the aim of Mr. Golish to show the complete development stages of a shell, from infancy to maturity, as well as the smallest and largest shells, and also any which are peculiar among their kinsmen. It is not the size of a shell which shows its development; this is judged entirely by its appearance. In forming this superb collection the Golishes eliminated any duplicate shells.

"The greatest task involved in this collection," said Mr. Golish to the writer, "is not in the actual collecting, but in keeping up the collection scientifically. Families are changed, others are combined. Constantly this changing is taking place at Washington."

Students of ethnology know that it was through the discovery of certain shells on the shores of San Nicolas Island, famed as the loneliest spot in the world, which at once led to the conclusion that San Nicolas and all the other islands in the Channel group of the Californian coast were once a part of the mainland. This is known to be true due to the fact that shells to match those of the San Nicolas coast were picked up on the shores of California. Again shells unearthed from the Indian graves in Iowa, Minnesota, and other parts of the country correspond in every detail with those native to the West Indies, leading at once to the deduction that in ancient times these shells were transported by the Indians either through Mexico or around by way of Siberia.

Shells for the Golish collection are never accepted unless alive. That is, the animals must still be in them, since a few days of exposure on the beach ruin the color and luster of a shell. Upon capture the shell with its animal is boiled, and the fine natural luster of the shells at the Southwest Museum show the resultant beauty, for each one shines as if the surface had been varnished. On certain shells the epidermis is difficult to retain, necessitating boiling the shell in glycerine to keep this outer layer from chipping off during the heating.

From Mr. Hirase, the greatest of Japanese chronologists, who at his own expense built a museum for the exhibition of shells in his native land, Mr. Golish has secured many choice specimens, one of which, the *latiaxis pilsbyi*, has only one counterpart and that is in the Academy of Sciences at Philadelphia.

Countless are the rare and costly shells in the Golish collection, but none with a more fascinating history than that of

One case of coral in the center of which is a specimen of coraline growth as yet unclassified among collectors. It was drawn up from a depth of 600 feet off the coast of San Nicolas Island.

cypraea aurautium, a shell of wondrous golden color, its name reminiscent of that glorious lily which the writer has grown in her own garden, the auratum or gold-banded lily of Japan. This shell has its habitat in the tepid water of Loyalty Island, in the Samoan group, and is regarded by the natives as a sacred shell. At the time Robert Louis Stevenson was living in Samoa, and during a period of much disturbance on the island, when American, English, and German men o' war were lying in the harbor, a native ruler, out of gratitude to the English ship for remaining there a year, while the other ships had returned to their respective homes, gave to one of its officers the largest of his collection of these choice shells.

The British officer, being much impressed by the beauty and exceptional size of the shell, asked for another, but though many skilled divers were sent down, no more like it were found. The widow of this officer came to live at Long Beach where Mr. Golish at one time conducted a shell store, and although she disposed of the precious shell at another shop in the same town, the employe who had made the purchase found that the proprietor of the shop would not refund him the money paid for it, and so the shell was taken to Mr. Golish who instantly bought it of the happy employe from the other shop for $50.

Both Mr. and Mrs. Golish have discovered shells hitherto unknown to conchology. The one found his on the beach at Santa Monica, California, the other found hers on the beach at San Nicolas. Instantly she saw the tiny specimen lying there Mrs. Golish recognized it as something new though the variation from certain other forms was very slight. No other like it has ever been found. In each case the shell was named after the finder, as scientific record shows.

From Los Angeles Harbor there is a group of shells taken from a depth of 1,500 feet—down where the water is ice-cold and all is in darkness. That region that the English poet, Arnold, so beautifully depicts in his "Forsaken Merman"—

> "Sand-strewn caverns, cool and deep,
> Where the winds are all asleep;
> Where the spent lights quiver and gleam,
> Where the salt weed sways in the stream,
> Where the sea-beasts, ranged all round,
> Feed in the ooze of their pasture-ground;
> Where the sea-snakes coil and twine,
> Dry their mail and bask in the brine;
> Where the great whales come sailing by,
> Sail and sail, with unshut eye."

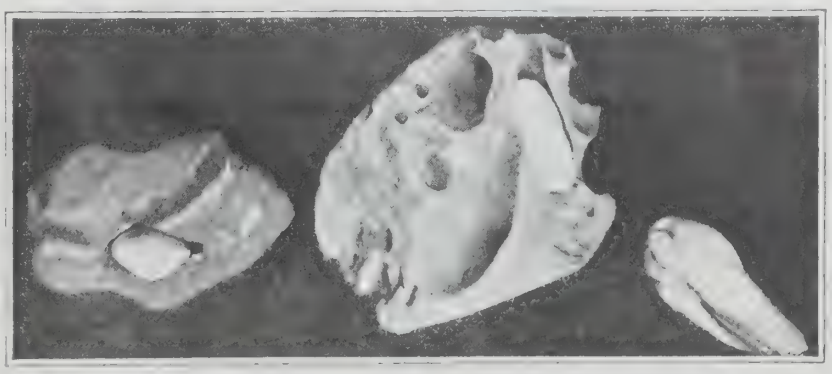
The shells brought from this far region are shaped to withstand the enormous pressure placed on them by the water.

In the famed waters that surround Catalina Island dwell the rare and remarkable *argonantidae*, or paper sailor, of which there are numerous specimens in the Golish collection. The female alone builds the lovely shell house, laying her eggs therein, while the male lives much as an octopus. These paper sailors sell for $1 an inch and are found after a storm.

The *cancellaris* is one of the rarest of shell families found on the Pacific Coast, and in one of the government bulletins published several years ago on conchology is found the photograph as well as the description of the world's largest and finest of this family which belongs to the Golish collection.

From the warmest waters of the globe come the loveliest shells—from the Gulf of California, from Florida, and especially from Japan. Though the same kind of shell may be picked up on the coast of Alaska as on that of China, each looks quite different, the one from China being far more artistic and beautiful than the homely and brittle shell from the cold North. Size, too, is thus affected. Take, for example, the cup-and-saucer family of shells on which group Mr. Golish par-

(*Concluded on page 14*)



These shells, belonging to the borer group, are able to make nests for themselves cut from rock, by means of acid and siliceous teeth together with a rasp-like tongue.

How Much Has It Cost the U. S.?

Concluded from page 2

bination must let the Independent get some business at any price or stand revealed as a 100 per cent monopoly.

I purposely here avoid charging any of these combinations or groups with having committed any infraction of the law, nor is there any intention here to imply an indictment because of their size. In fact, the courts of the United States have refused to give disapproval by a majority decision to the size of one of these great combinations. What I am pointing out is that their size, which has got beyond the control of state governments owing to these groups combining and crossing state lines, constantly stirs the public to call upon the Federal Government to do something with them.

In the farm implement business a combination, organized in 1902, was composed of five companies that formerly competed. At its inception this combination controlled 90 per cent of certain lines of the farm machinery industry of the nation. Almost from the beginning it has been before the United States Courts, Congress, or the Federal Trade Commission, for investigation or enforcement of orders or decrees.

In the steel world there is a super-combination composed of eight great combinations, including what were originally 130 independent companies scattered over the United States. Its present output is somewhere near 50 per cent of the steel produced in the United States. It is no stranger to courts, commissions, or legislatures.

In 1906 a combination having to do with manufacture and the sale of products derived from corn absorbed nine companies that were independent competitors. At one time it had 100 per cent of the industry, but since a judicial decree of 1919, represents about 50 per cent of the corn products business.

Timber Ownership Is Becoming More Concentrated

The Standard Oil group, since the dissolution of that combination by the Supreme Court, has handled, as late as 1922, about 45 per cent of the refined oil products. One large company controls more than one-third of the output of tin cans which are used as containers for our supply of canned vegetables and fruits.

In the anthracite business eight large companies, with a "community of interest," produce about 75 per cent of the total output and control perhaps 90 per cent of the coal in the ground. Most of these companies were formed by consolidating groups of independent companies. Last year when there was a shortage of anthracite and this, together with high prices in New England, caused great suffering, the President appointed a commission to investigate the anthracite situation. That commission in the twelve months' period of its existence spent $600,000. Should another such emergency develop is it not reasonable to expect that there will be a great drive made on Congress to put the industry under governmental regulation through the creation of an additional bureau?

In the lumber world timber ownership is becoming concentrated more and more. As far back as 1913 the Commissioner of Corporations reported that 39 per cent of all long-leaf yellow pine and 29 per cent of the cypress was controlled by 67 holders, and one-half of the Douglas fir by 37 holders, many of which were closely connected, while the three largest holders alone had nearly 25 per cent of the privately owned Douglas fir timber.

While there are 4,800 commercial flour mills in this country, not less than 27 per cent of the total output of wheat flour was produced in 1921 by eight large companies.

In the bread world, the ultimate consumer became so agitated in 1923 that Congress passed a resolution requesting the Federal Trade Commission to investigate the baking industry.

Of commercially baked bread approximately 2,494,600,000 pounds was purchased in 1923 by eight baking companies. An estimate based upon data published by one of the baking trade papers shows a total annual commercial output of 12,117,600,000 pounds for the country. The eight companies in 1923, therefore, baked about 12 per cent of the total commercial output.

In November, 1924, a baking corporation announced an authorized capital of $600,000,000 and stated, according to press reports, that it proposed to acquire two other great baking corporations. According to the United States census, the total capitalization of the entire baking industry in the United States, including 25,095 establishments in 1919, was $509,266,000, which was nearly $100,000,000 less than the authorized par value of the capital stock of this baking corporation. Now the baking industry is under investigation.

Farmers Have Struggled About Prices

The records of Congress and of our administrative departments are encumbered with resolutions, investigations, orders, and decrees without end, directed at these various groups.

One of the most enlightening investigations that could be made in the public interest would be to learn how many hours, how many dollars, and how many persons have been employed by legislative, executive, and judicial departments in the last forty years, either directly or indirectly, seeking to understand or to check the movements of business combinations. Instead of growing less, these efforts and expenditures of the government are increasing in numbers. From time to time public pressure becomes so great that Congress creates an additional bureau or division to supervise those under investigation.

Look for a moment at the packing industry. There was a day when the acts of those in this business aroused no irritation. In fact, their efficiency was not only not feared, but the business genius of those in control admired. That was before the days of combining. The records show that one of the largest started with an investment of $160,000. Subsequently this corporation purchased 24 independent competing plants in 12 states. According to a statement of a vice-president of this company, it is engaged in 47 distinct lines of business and controls 148 subsidiary companies. The original capital stock has expanded to $400,000,000. A like picture could be drawn of another one of the mastodon combinations in this industry.

The records of Congress, the Department of Justice, and the Federal Trade Commission show that the so-called Big Five Packers, who have recently been reduced by absorption to the Big Four, have been, since 1902, almost continuously under investigation or prosecution. Three years ago Congress passed the Packers and Stock Yards Act and added to the Department of Agriculture a division with an appropriation, now, of more than $450,000 a year and a number of employes to supervise and control that industry.

The farmers of the United States for some years have been struggling with the prices which they have obtained for their grain in the great markets of Minneapolis and Chicago. In Minnesota and the Dakotas what practically amounted to open warfare broke out between these farmers and the Exchange at Minneapolis, in an uprising that gave occasion for political action. Toward the Chicago Board of Trade the farmers became suspicious of the alleged manipulation on the part of the speculators who, in some instances, were the great grain buyers of that market.

Wholly aside from the question as to whether the farmers were right in their belief as regards these exchanges, the fact remains that pressure for action upon Congress was irresistible and, as a result, the Grain Futures Act was passed centralizing certain control in the Federal Government over the grain business.

I have often been asked what is so difficult about the actions of these great combinations that they cannot be grasped by the mind of the average citizen. Of the many instances, let us consider the method for determining the price charged for rolled steel throughout the United States. At Pittsburgh, where the United States Steel Corporation has plants, it charged, let us say, a price of $50 a ton for rolled steel. At Chicago it also has plants. There it charged $50 plus $7.60, a sum equivalent to the freight from Pittsburgh to Chicago, for the Chicago consumer, though he bought the steel at the Chicago plant and, notwithstanding, it had never been on a railroad track. It likewise added $13 a ton, over the $50 at its plant at Duluth, and $11 at its plant at Birmingham. The so-called Independents, apparently because of the dominance of the Steel Corporation, followed its prices so that the Colorado Fuel and Iron Company, located at Pueblo, Colorado, might charge the consumer of that city the Pittsburgh price of steel plus approximately the equivalent of the freight to Pueblo, which was about $27 a ton. It is obvious that the Pittsburgh consumer, purchasing his steel in Pittsburgh and manufacturing it into steel products, could keep the Chicago consumer, with his handicap of $7.60 a ton, from getting very far east, while the Pittsburgh consumer could go into Chicago, Duluth, Denver, and other points, on an equality with the western consumer.

When a Colossus Arises in an Industry

Now, while the United States Steel Company in a very commendable spirit accepted the order of the Federal Trade Commission to desist from this practice, it took the Federal Trade Commission five years of constant effort to inform itself with sufficient certainty of the historical, economic, accounting, and legal facts before it could base an order on this data. It spent more than $85,000 in doing so and took 19,000 pages of testimony.

Is it a wonder that the ultimate consumer, the farmer, or the housewife is unable to understand the mysteries of big business, when the Federal Trade Commission, with all its skilled accountants, economists, and lawyers, must spend such time, money, and effort to unravel its mysteries?

It is an historical truism that man fears that which he cannot understand. Hence the disturbance made upon the public when a colossus arises in an industry. Absentee control and ownership, a thing with which the single corporate unit which I have described is not often handicapped:

Domination so great that the so-called "Independents" in an industry must not go below the minimum price of the great combination during normal times lest they be crushed; prices high enough to sustain the highest cost plants of these great combinations, as well as of some of the Independents.

Fear on the part of the smaller Independent to reduce its prices below the prices of the dominant group, even though it has a lesser freight problem, closer supervision, and smaller overhead; lack of control by local officials and legislatures over the interstate business of the combination; a general increase in the cost of living even before the war, despite patents and labor-saving devices in every industry that should have reduced the high cost of living—these are a few of the things going to make up a background that causes a confused public to seek the aid of the Federal Government.

Hence we find, despite the approval of "less government in business" by statesmen, officials, and business men, that we continue to add bureaus and commissions. There is no escape from this dilemma as long as we permit price-fixing associations to destroy competition or centralization of economic power in business combinations that are built up by merging competitors whose united business is beyond state control, and whose actions cannot be understood or grasped by the common mind.

(Mr. Thompson, in a succeeding article, will tell how various public groups would attempt to solve this problem.)

Gems of the Ocean

Concluded from page 13

ticularly prides himself, those from the Gulf of California are much larger than those found in the cooler waters of Los Angeles Harbor. As with birds and fishes, so with shells, the most colorful dwell in the warmer zones, and this influence is, of course, very evident in the dress and artistry of the peoples dwelling in these climes.

There are two great classes of shells, the land and the water shells, and in the Golish collection are many of the latter gathered from rivers. The study of those land shells, called snail shells, forms a most interesting section in this conchology gathering of unsurpassed magnitude. Coral and sponges from all parts of the world are also in evidence. There is, for one, a very large and beautiful glass sponge found by Mr. Golish in Santa Monica Bay, a similar specimen of which does not exist. Those lovely glass sponges forming the Venus flower baskets found in Philippine waters, the first discovered bringing $500 at a sale in England, always attract the eye.

The microscopic section of this shell collection was dredged for by the Golishes at both Los Angeles Harbor and at Catalina. It is interesting to note that shells, no matter how minute, never interbreed. Still more interesting is the fact that when a shell is broken it will go in quest of lime or whatever substance is required for its mending process, and thus become as new. Numerous specimens at the Southwest Museum give evidence of this procedure in mending.

Almost all shells have egg cases and when born can swim. Shells are great travelers. For example, a colony of 1,000 razor clams on being disturbed jumped a foot or two into the air and across the water about three feet, making a swift and spectacular migration. The Golishes have also witnessed groups of abalones crossing a sand bar at a lively pace.

These are but a few of the facts concerning shells which enliven the subject for the layman. The maker of a collection of shells must busy himself with data far more intricate, for more exacting.

"Since we donated our collection to the Southwest Museum in 1914," Mrs. Golish told the writer, "my husband has been working on the collection every day until his present illness, from morning until 10 or 11 o'clock at night, sometimes even having his meals brought to him at the large table where he worked at home."

The two who have developed this amazing collection and donated it to future generations, without any monetary recompense whatsoever, are not persons of wealth. Whereas others have given much of their time and money to those things commonly called the pleasures of life, these two have made the accumulation and assortment of this internationally known shell collection both their joy and their work.

Chimney Rock on the Cody Road

By JAMES CLYDE GILBERT

MAJESTIC in its retreat, overlooking the waters of the Shoshone River, stands the famous Chimney Rock on the road from Cody, Wyoming, to Yellowstone National Park.

It is perhaps ninety feet in height. The surface facing the road is twelve feet across and is not more than two or three feet in thickness. It stands only a few feet from the face of the cliff which forms a background beautiful to behold when the slanting rays of the sun bring out the colors of the various rock formations.

The rock is situated on the main highway from Cody, Wyoming, to Yellowstone Lake in Yellowstone National Park. As it is on the highway, not more than eight or ten feet from the road, Yellowstone Park tourists using the Cody Road have an opportunity to inspect this interesting landmark. This district is noted for its beauty and the strange forms of the rocks thereabout. Columns, "cathedral spires," and giant figures sometimes having human likenesses abound.

(C) Chicago Burlington & Quincy Railroad.

The tapering spire of Chimney Rock.

Hints on Bird Houses —By D. LANGE

WITH the progress of more intensive cultivation of the land and the disappearance of old hollow trees, a number of our most desirable song birds and insectivorous birds are being more and more hard pressed in finding suitable nesting sites. There is a decided housing shortage for these friends of man.

The best time to make and put up bird houses is in late autumn and early winter. Most bird house contests and bird house exhibits are held too late for obtaining good results the first season.

Among the most desirable bird neighbors are bluebirds, wrens, nuthatches, chickadees, woodpeckers, martins, and tree swallows. Of this list only the woodpeckers can act as their own carpenters. All the other species must depend on natural cavities or on cavities made but not used by woodpeckers.

A well-placed bluebird house which is occupied every season. Notice the tin collar around the post.

The best bird houses are those made of sections of hollow trees or large branches with the natural bark adhering. It is best to cut those sections during winter, when the bark will not peel or become loosened. It is not advisable to tack bark on sawed boards. Bark tacked on always warps and gives shelter and breeding places to bird vermin.

If sections of natural trees and branches are not available, rough sawed boards, well weathered, should be used. Neither the inside nor the outside surfaces should be planed; and a bird house should not be painted, with the possible exception of martin houses. A dark-green or dark-brown stain is not objectionable.

The birds most easily attracted to bird houses are bluebirds and wrens. Their houses should be placed on a post from six to ten feet high. A ring of tin, about ten inches wide, should be nailed around the post to make it impossible for squirrels and cats to reach the nest.

If bird houses are nailed to the walls of a building, they should not be exposed to the noon and afternoon sun. Trees or bushes should not be more than a rod away, so that the young birds may quickly reach shelter when they leave the nest. If they flutter about on the ground for any length of time, cats or other enemies will get them.

It is best to use screws in the construction of bird houses, because nails will nearly always become loosened and cause open joints, which are objectionable to the birds.

The least desirable place for bird houses is on trees, because houses so placed are nearly always accessible to cats and other enemies.

It is not necessary, but it is better to clean out the bird houses and remove the old nesting materials. A friend of mine, whose bluebird house is occupied every season, cleans out the old material in February or March, before the birds have returned. In the bottom of the house, he always places a layer of about two inches of fresh damp garden soil mixed with sawdust, about half and half.

This mixture makes a good foundation for the nest and holds a little moisture like dead spongy wood in natural tree cavities. This new idea deserves a general trial in widely separated localities.

The most desirable and interesting tenants are the bluebirds. Their number is showing a marked increase, on account of nesting boxes put up for them. Within the last few years I have seen as many as forty bluebirds in one flock in late autumn.

McGuffey's Maxims

Little Tales of Conduct From the Famous School Reader of the Last Generation

The Clock and the Sun-Dial

1. ONE gloomy day, the Clock on a steeple looking down on the Sun-dial in a garden near by, said, "How stupid it is in you to stand there like a stock.

2. "You never tell the hour, till a bright sun looks forth from the sky, and gives you leave. I go merrily round, day and night; in summer and winter the same, without asking his leave.

3. "I tell the people the time to rise, to come to dinner, and to go to church.

4. "Hark! I am going to strike now: one, two, three, four. There it is for you. How silly you look. You can say nothing."

5. The sun, at that moment broke forth from behind a cloud, and showed, by the Sun-dial, that the Clock was half an hour behind the right time.

6. The boasting Clock now held his tongue, and the Dial only smiled at his folly.

MORAL.

7. Humble modesty is more often right, than a proud and boasting spirit.

The Flight of Lincoln's Assassins

Concluded from page 9

Fresh. 'The coast seems to be clear,' I said, 'and the darkness favors us. Let us make the attempt.'

"With difficulty Booth was raised by Herold and myself and placed upon my horse. Every movement, in spite of his stoicism, wrung a groan of anguish from his lips. His arms were then given to him, the blankets rolled up and tied behind him on the horse, and we began the perilous journey.

"At last, after what seemed an interminable age, we reached my place. We stopped under a pear tree near the stable, about forty or fifty yards from my house. It was then between nine and ten o'clock. 'Wait here,' I said, 'while I go in and get you some supper which you can eat here while I get something for myself.'

"After supper we resumed our journey across the open field toward the longed-for river. Though there was now little danger of meeting any one, I walked ahead, taking the same precautions I had used during the more hazardous part of our journey. Presently we came to a fence that ran across the path, about three hundred yards from the river. It was difficult to take it down; so we left the horse there and Herold and myself assisted Booth to dismount and, supporting him between us, took our way carefully down the tortuous path that led to the shore.

"The path was steep and narrow and for three men to walk down it abreast, one of them being a cripple, to whom every step was torture, was not the least difficult part of that night's work. But the Potomac, that longed-for goal, at last was near.

"At length we reached the shore and found the boat where Henry had been directed by me to leave it. It was a flat-bottomed boat about twelve feet long, of a dark-lead color. I had bought it in Baltimore the year before for eighteen dollars.

"We placed Booth in the stern with an oar to steer; Herold took the bowseat to row. Then lighting a candle which I had brought for the purpose—I had no lantern—and carefully shading it with an oilcloth coat belonging to one of the men, I pointed out on the compass Booth had with him the course to steer. 'Keep to that,' I said, 'and it will bring you into Machodoc Creek. Mrs. Quesenberry lives near the mouth of this creek. If you tell her you come from me I think she will take care of you.'

"I then cautioned them to keep the light hidden and said 'Goodby.' I pushed the boat off and it glided out of sight into the darkness.

"I stood on the shore and listened till the sound of the oars died away in the distance and then climbed the hill and took my way home."

The following is from the diary of John Wilkes Booth, written while he and Herold were making a frantic attempt to escape:

"Te Amo."

April 13-14, Friday, the Ides.

"Until today nothing was ever thought of sacrificing to our country's wrongs. For six months we had worked to capture. But our cause being almost lost, something decisive and great must be done. But its failure was owing to others who did not strike for their country with a heart. I struck boldly, and not as the papers say. I walked with a firm step through a thousand of his friends; who stopped, but pushed on. A colonel was at his side. I shouted *sic semper* before I fired. In jumping broke my leg. I passed all his pickets. Rode sixty miles that night, with the bone of my leg tearing the flesh at every jump.

"I can never repent it, though we hated to kill. Our country owed all her troubles to him, and God simply made me the instrument of his punishment.

"The country is not . . . .

"April, 1865

what it was. This forced union is not what I have loved. I care not what *becomes* of me. I have no desire to outlive my country. This night (before the deed) I wrote a long article and left it for one of the editors of the *National Intelligencer,* in which I fully set forth our reasons for our proceedings. He or the Gov't.

"Friday, 21.

"After being hunted like a dog through swamps, woods, and last night being chased by gunboats till I was forced to return wet, cold and starving with every man's hand against me, I am here in despair. And why? For doing what Brutus was honored for. What made Tell a hero? And yet I for striking down a greater tyrant than they ever knew am looked upon as a common cutthroat. My action was purer than either of theirs. One hoped to be great. The other had not only his country's but his own wrongs to avenge. I hoped for no gain. I knew no private wrong. I struck for my country and that alone. A country that groaned beneath this tyranny and prayed for this end, and yet now behold the cold hand they extend to me. God *cannot* pardon me if I have done wrong.

"Yet I cannot see my wrong except in serving a degenerate people. The little, the very little, I left behind to clear my name, the Gov'mt will not allow to be printed. So ends all. For my country I have given up all that makes life sweet and holy, brought misery upon my family, and am sure there is no pardon in the Heaven for me since man condemns me so. I have *only* HEARD of what has been done (except what I did myself), and it fills me with horror. God, try and forgive me, and bless my mother. Tonight I will once more try the river with the intent to cross.

"Though I have a greater desire and almost a mind to return to Washington and in a measure clear my name—which I feel I can do—I do not repent the blow I struck. I may before my God, but not to man. I think I have done well. Though I am abandoned, with the curse of Cain upon me, when, if the world knew my heart, *that one* blow would have made me great, though I did desire no greatness."

"Tonight I try to escape these bloodhounds once more. Who, who can read his fate? God's will be done.

"I have too great a soul to die like a criminal. O, may He, may He spare me that, and let me die bravely.

"I bless the entire world. Have never hated or wronged any one. This last was not a wrong, unless God deems it so. And it's with him to damn or bless me. And for this brave boy with me, who often prays (yes, before and since) with a true and sincere heart, was it crime in him, if so, why can he pray the same?

"I do not wish to shed a drop of blood, but I must fight the course. 'Tis all that's left me."

The wanderings of the next few days, beginning with April 21, are covered in interviews by W. N. Walton in May, 1865, for Washington newspapers. He talked with Lucas the Negro, Dr. Stewart, and Mrs. Quesenberry. George Alfred Townsend who wrote voluminously of the assassination at the time, and in the *Century Magazine* for April, 1884, describes how Booth and Herold crossed the Potomac and reached Port Conway. Victor Louis Mason retold the story more in detail in the *Century* for April 1896, and in 1900 O. H. Oldroyd, of the Oldroyd Lincoln Museum, interviewed people all along the route confirming the stories previously written.

Instead of crossing as they had planned, the assassins, due to darkness and inexperience, found themselves when Saturday morning broke on the side of the river from which they had started. Landing, Herold obtained food at the home of Colonel John J. Hugh and again told what Booth had done. Later during the day they were seen entering their boat by a Negro who, thinking they answered the description of Booth and Herold, reported it to the authorities.

On Saturday night the fugitives were more successful and reached Gambo Creek on the Virginia side. Sunday morning Herold called at Mrs. Quesenberry's, about a mile from where they had landed. He told her that he had been directed to her by Thomas Jones, and once more stated that he had with him the man who killed Abraham Lincoln. Following Herold, she was led to Booth's hiding place where she found him in great pain from his broken leg. He requested that he be taken to the nearest physician and stated that now being among friends he anticipated little danger.

That afternoon, Sunday, Mrs. Quesenberry, with the aid of a neighbor, William Bryan, sent them to Dr. Stewart, eight miles away, where they arrived about 6 o'clock. Dr. Stewart, suspecting their identity, after giving them supper would not allow them to remain longer and they went about a quarter of a mile to the hut of William Lucas, a Negro, where they spent the night.

The next morning Booth sent Dr. Stewart the following note:

"Dear Sir: Forgive me, but I have some little pride. I hate to blame you for your want of hospitality; you know your own affairs. I was sick and tired, with a broken leg, in need of medical advice. I would not have turned a dog from my door in such a condition. However, you were kind enough to give us something to eat, for which I not only thank you, but on account of the reluctant manner in which it was bestowed, I feel bound to pay for it. It is not the substance but the manner in which kindness is extended that makes one happy in the acceptance thereof. The sauce in meat is ceremony; meeting were bare without it. Be kind enough to accept the inclosed two dollars and a half (though hard to spare) for what we have received.

"Yours respectfully,

"Stranger."

April 24, 1865
To Dr. Stewart

Lucas procured a wagon and about 3 o'clock that Monday afternoon, deposited Booth and Herold at the Port Conway end of the Rappahannock River ferry, fifteen miles farther south. Lucas stated about ten days later that on the trip to Port Royal Booth seemed much fatigued, and laid down in the bottom of the wagon and slept at intervals.

In an article to follow the flight of the fugitives will be concluded and there will be told the story of the pursuit.

THE ILLINOIS AGRICULTURIST URBANA

BRIEFLY TOLD

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. The set includes: "The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

Only 2 per cent of the American farmers paid any Federal income tax in 1920.

Iceland moss is much used for food in the island from which it gets its name. It is ground with flour and added to soups for thickening.

The oldest known will was executed in 2548 B. C., it being that of the Egyptian Uah.

West Point's coat of arms has been changed. For more than thirty years the coat of arms consisted of a perpendicularly striped shield bearing on its face a helmet of Mars through which a sword ran diagonally downward from the right or "sinister" side. Surmounting all was an American eagle, facing the sinister side of the shield. Both eagle and sword have been reversed.

There are 30,000 churches in 10,000 villages of the country without regular ministers, according to Dr. John McDowell.

Joseph Cundall, a London artist, is credited with having issued the first real Christmas card in the year 1846.

A prize hen was rescued from a death of strangulation when its owner performed an operation on its neck. Its neck was cut open, the crop was opened and a wad of alfalfa, weighing four ounces, was removed. The incision was then sewed up and the hen is on the road to recovery.

Inspire not men with fear, else God will fight against thee in the same manner. Let one provide sustenance for them in the lap of peace; it will then be that they will freely give what has been torn from them by terror.—Precepts of Ptah-Hotep, 2500 B. C.

The government of Jerusalem has issued a decree that all automobile horns be replaced by bells.

Brazil occupies more than half the South American continent.

Monkeys of Borneo are so troublesome to rubber growers that the plants while young are guarded.

Edible birds' nests, lined with a glutinous substance suitable for soup making, much prized by the Chinese, gave the government of Borneo an export duty of more than $100,000 in 1920.

Southern Greenland is moving away from Scotland at the rate of 60 feet to 125 feet a year and Iceland is wearing away from Norway from 60 to 63 feet annually.

If then thou hast to do with a disputant while he is hot, imitate one who does not stir. Thou hast the advantage over him if thou keepest silence when he is uttering evil words. "The better of the two is he who is impassive," say the bystanders, and thou art right in the opinion of the great.—Precepts of Ptah-Hotep, 2500 B. C.

Professors in German universities are not obliged to lecture to less than three students.

More tin is mined in Alaska than all the rest of the United States.

The black patch appearing on a soap bubble just before it breaks is caused by thinness at this patch, resulting in very little light reflection.

There are more than 50,000,000 "untouchables" in India, to speak to whom is to lose one's caste.

The Javanese believe that the souls of their forefathers are housed in crocodiles.

When a child is born in British Guiana the father takes to his hammock, where he remains for some time, abstaining from all work and all but the simplest food while he is nursed and cared for by the women of the place.

The per capita consumption of milk increased 12 per cent in the United States from 1913 to 1923.

Bubonic plague was first recorded as occurring in A. D. 542 in Pelusium, Egypt, it having spread by trade routes over the then known world, until, at its height, the mortality was from 5,000 to 10,000 persons a day.

The Hawaiian Islands were named Sandwich by Captain James Cook when he explored them in 1778, but the name did not remain.

New Zealand sheepmen are troubled with two plagues, the rabbits which eat the grass, and the kea, a species of mountain parrot which bores holes in the sheep's back and eats the fat away from the kidneys.

The first cheese factory in Wisconsin was erected at Ladoga in 1864.

Peat in the United States is used more for fertilizer and stock food than for fuel, as in Europe.

The expression, "Jitney," first came into general use in 1915, when various cities established auto busses giving a ride for five cents.

CHRONICLER OF THE NEGLECTED TRUTH

"I Read in the Papers—"

I read in the papers that the "crime wave" is being more and more attributed to "lack of religion." To what is the lack of religion attributed? I think that is the really important question. Crime can be accounted for. A large proportion of our crime has always existed, but not as crime; it was legal; a change in the laws has turned it into crime. That is why thousands of lawbreakers do not and cannot feel like criminals. Another large portion of our crime is just pure alienism. It is not a degeneracy that has occurred here, it is an importation from elsewhere. It is not due to moral lapse on the part of the American, it represents the normal level of life in countries whence most of our more recent immigrants have come. These aliens are not consciously criminal, and often not intentionally law-violating; they are just natural. But "lack of religion"—that is the really puzzling fact, for it is a fact. It is not so puzzling out in the world; not much religion is ever expected there. But it is extremely puzzling where one naturally looks for religion—in the church. The lack of religion in the church—is that the cause of the crime wave? Certainly not. Yet it is by spokesmen of the church that crime and the "lack of religion" are connected, and it really is not clear how the lack is to be filled except by the church. How does it propose to do it? After it has kept its own machinery turning, has it any surplus force to expend outside? Its preventive inside service is undoubtedly great, and its right and ability to act as critic of the world is acknowledged. But has it dry-dock facilities to overhaul humanity? Has it an antitoxin strong enough and in sufficient store to heal mankind? If the church's diagnosis is true, it seems to call for something more than diagnosis. How is the lack of religion to be filled?

I read in the papers that Scott Nearing has been around again. I remember when he and Max Eastman used to be invited around quite regularly—Max with his perfectly candid assertion that when he had achieved Socialism for the world, his next step would be to overthrow it, and Scott with his ill-commanded pose and his essentially boyish mind somewhat soured under its mass of undigested ideas. Really progressive minds, typically American, measured these men at once and placed them at one side. But what surprised me was that the professional radicals also seem to have tired of them. They are both showmen of the Mencken type who never win followers but who sometimes get the yokels to gape around their booths. Mencken is cleverer, however, since he only leers at precious things and insults his audience to their faces. All three are examples of arrested development; they are fixed; their booths are at the side of the road. *Everybody passes through the Nearing, Eastman, Mencken stage, except Nearing and Eastman and Mencken; they stay there.* That is their tragedy. But, as I was saying, Scott has been around again scattering pearls before some university students. "The United States is the old moss-covered conservative fringe of the world," said he. "The United States is the backwash of civilization, the tail of it. The United States is the only country in the world which has not had a revolution in government during the last 100 years." The United States, except the one other country most like it, is also the only country where statements like these can be made with full liberty, where a man's constitutional right to make them is defended by citizens who disagree with them, where people have occupation, where little children have food and health and homes, where university students are not prohibited from examining every species of economic and political aberration, and where governmental changes are no longer accomplished by the archaic and obsolete method of revolution. Personally, I'm for sending Mencken on tour through the "Bible Belt" and Nearing through the universities.

I read in the papers the news that "Rabbi Browne" of New York was in trouble, and was glad to learn that an organization of Jewish women had sympathetically taken up his case. If the persons responsible for his arrest had inquired into the matter, they would have learned that this was hardly the way to proceed. I came across Rabbi Browne several times, and it was an obsession of his that he could deliver the Jewish vote to such an extent as to determine a Presidential election. When I knew him, however, he was not asking money for his services, he was only asking an orphanage for fatherless and motherless children in Jerusalem. He lives in the memory of past glory. It seems that he had been an honorary pall-bearer at the funeral of U. S. Grant, and he preserved many newspaper clippings describing his eloquence in years gone by. His thoughts and plans, as they were expressed to my knowledge, reflected a desire to be of use and indicated a general kindliness of character. It was obvious that he was living in the past, a pathetic old man who instinctively fought against the tragedy of having to give up active usefulness. With it all, he had a broadminded conception of Jewish and American affairs that many of his co-racialists might be proud to possess.

I read in the papers this headline—"President May Drop Old Guard as Aids and Depend on New Men." It is sincerely to be hoped that the correspondent whose story is thus headed is prophetic. The Republican crowd that was in such terrible straits last fall, and which was pulled out by popular faith in Mr. Coolidge, has no right to rule. Mr. Coolidge was chosen as the "new conservative"; but the crowd in power represents the old reactionism. There is no hesitation in saying that if Mr. Coolidge is what we thought he was, he cannot work with the old crowd. If he does, he will not accomplish anything and will lose his own status. There hasn't been any house-cleaning in Washington to speak of. Scandalous points have been attended to, but reactionary, unprogressive points have been left untouched. Politics is rampant. Things haven't been going as well as the people have had a right to expect. Surely Mr. Coolidge is not unaware of this.

The Ford International Weekly

THE DEARBORN INDEPENDENT

Entered as Second-Class Matter at the Post Office at Dearborn, Michigan, under the Act of March 3, 1879. Additional entry at Chicago, Illinois.

By the Year $1.50 | Published Weekly | Dearborn, Michigan, April 11, 1925 | 25th YEAR No. 25 | Single Copy Ten Cents

MR. FORD'S Page this week discusses the statement that our generation moves at too fast a pace. (p. 7)

AARON SAPIRO has not, at this writing, sued THE DEARBORN INDEPENDENT, though he has induced practically every newspaper in the United States to say that he has. The delay in getting the truth well aired in court makes it necessary for us to print now and again a little of the overflow. This week we print some interesting facts about the plan to control American cotton. If the word "Jew" occasionally occurs, it is because Jews are scattered freely all along the line of the plan. (pp. 4 and 15)

WHEN the body lies horizontally the heart has less pumpage to do than when the body stands up. Mr. Edison long ago found that out. His cat-naps are heart rests. Always ready to share with others the wisdom he has won from experience, Mr. Edison says some mighty sensible things about rest and sleep. (p. 2)

FORBES-ROBERTSON as he is at his fireside. Chitchat about American audiences, noted actors, Bernard Shaw as a rehearsal director, and dainty drawings of the house and Bedford Square, make a readable sketch. (p. 3)

THE absorbing narrative of the John Wilkes Booth Myth proceeds in this number. Thus far the known facts of the assassination of Lincoln and the flight of the murderer have been dealt with, to furnish a background for the strange claims which afterward arose. The article this week describes in detail, from the words of eyewitnesses, the dramatic capture made at the Garrett farm. (pp. 11 and 14)

EVERY little while someone starts up the idea of a universal language. We have had Esperanto and Volapuk, and numerous other manufactured tongues. But all the while there was a universal language slowly but surely making its way through all countries and races and becoming the master tongue of the world. It is the English Language. The mystery of language is very great, of our language in particular. It is really worth everyone's while to consider the facts presented in this article. (p. 10)

MAYBE you have noticed our resurrection of McGuffey's readers in the last few numbers. The old schoolmaster's maxims live because they are eternally true. Besides, they are interesting as illustrating the method of the Father of the Modern School Reader. (p. 6)

AN AUTHORITATIVE sports writer says that the Davids, or little fellows, have it over the big fellows or Goliaths, in the sports game. Bantams have grit and endurance. A pretty chesty article for all short men to read. (p. 9)

AND a lot of miscellany: The first Bible printed in America, and where the Easter Palms come from. (p. 12) Postal employes' increase. (p. 6) Strange happenings in the Pacific which are changing the peaceful temper of that ocean. (p. 5) Story of Hudson's Bay Company. (p. 13) Editorials, Briefly Tolds, I Read in the Papers. (pp. 8 and 16)

What Edison Thinks About Sleep

"O Sleep! It Is a Gentle Thing"

How Much Sleep Do You Require? Edison Takes All He Needs

By ALLAN L. BENSON

SLEEP has been called the sister of death. According to Edison it would be more nearly accurate to characterize it as the brother of life. Sleep makes no strength but gives the strength that is in us an opportunity to accumulate. Steam must accumulate in a boiler before it can be made to drive an engine.

Edison is always pictured as a man who goes short of sleep and the world has long wondered how he does it. The answer is that he does not do it. Edison always gets all the sleep he needs. Except in the old days, when he used to drive himself during the final period of an invention, nobody has ever seen him look tired. He can go to sleep in a minute and wake up in a second. At midday, he will go to sleep at 12:40 o'clock and leave a request to be called at 1 o'clock. Lay a hand on his shoulder at 1 o'clock, and he is up in an instant, wide-awake. His eyes never have to take time to open. Even after several hours' sleep, his eyes, he says, are perfectly clear and light as feathers, the moment he awakens.

Edison sees in every man two men. There is the man of flesh and bones who is of no importance except for the fact that he carries around the real man—the intellect. Which of these two men is it that needs sleep—or do they both need it? I take it that Edison believes pure intellect never wearies—that it could work on and on forever without feeling the slightest strain. But in man intellect works through matter; and matter, pushed too hard, undergoes chemical and perhaps other changes, the results of which we call fatigue. It is then the less important man—the physical man—who becomes weary and must be rested.

The Burden Put Upon the Heart

What is it that bears so hard upon the physical man that after sixteen hours of consciousness he must seek rest in unconsciousness?

"Chiefly," said Edison, "it is the burden put upon the heart by keeping the body in a sitting or standing position. When a man is up and about his heart is always working against gravity. It must take his blood when it gets to his feet and raise it, between five and six feet, to the top of his head. Gravity is pulling against the heart all the time, but the heart must keep on. During the course of a day, this is equivalent to the lifting of several tons.

"When we lie down, a great burden is instantly taken off the heart. The great pump within us need then no longer lift; it has but to stir the blood, as it were, and keep it moving in level channels. That is why one can rest without sleeping. Merely to lie down gives the heart an opportunity to decrease its drafts upon our vitality. It is like decreasing the current going to a motor when some of the load is taken off.

"But we do not fully rest unless we become unconscious. That is because we do not know how completely to relax so long as we are awake. One cannot rest well when he is asleep unless he relaxes equally well. Rest and relaxation bear a definite proportion to each other. I have always been able to relax almost instantaneously and, I should say, completely. I do not know exactly how I do it. Of course, I know I turn my mind off the moment I lie down. That is the main thing. One cannot sleep and plan, or sleep and worry, at the same time. If one wants to do a good job of worrying he should keep awake. Worrying is always a sign of a lack of poise or a lack of intelligence. It is more destructive, perhaps, than anything else we do.

Never Take Your Work to Bed With You

"I suppose that relaxation begins with a healthy body and continues as a matter of habit. If one hasn't the habit, the thing, therefore, is to go about it at once to acquire it. Never take your troubles or your work to bed with you. Lie on your back in such a manner that there need be not the slightest strain upon any muscle in your body. If you feel a strain anywhere, move your body a little. Assume such a position that not a single muscle will have to tighten to hold you where you are. And, when you have done this, close your eyes and shut off your brain. If you are in good condition, you will be asleep before you know it.

"If you are not in good condition, find out what is the matter and remedy it. If your stomach is complaining, do what it wants you to do. There is no use arguing with a stomach. All that a good many persons need to do to sleep better is to get away from the trough. They eat too much. They are stuffed with poisons of their own manufacture.

"Some persons do not sleep well because they do not take enough exercise. Absurdly enough, some of those who take the least exercise eat the most food. What right has anyone to expect to sleep who stuffs and loafs? We should always remember that sleep is the natural thing. It is not something that we have to coddle and coax to bring about. Live right and it will bring itself about. Inability to sleep is always a sign of bad habits."

Edison, however, does his sleeping in a very different way than most of us do it. He does not go to bed at 10 or 11 o'clock at night and stay there until morning. He sleeps several times during the 24 hours, his various naps ranging from 20 minutes to an hour. He takes a nap in the middle of the day, another perhaps during the latter part of the afternoon, another one during the evening, and goes to bed around midnight or a little afterward. He has always had a cot in an alcove in his laboratory. It has nothing on it but a dark woolen blanket. I have seen his white head on that cot many a time; his eyes closed; his great brain "turned off." After 20 minutes or so, his assistant, Mr. Meadowcroft, would lay his hand on the "old man's" shoulder, and he would get up instantly and stalk off toward his desk as if he had just thought of something important that he wanted to do.

Edison's cat-nap sleeping may seem like a piece of nonsense, but he considers it high wisdom and the reasons he gives for thinking so are very compelling. Edison's idea is that it is not well to push fatigue too far, and that it is, therefore, well to rest just before one becomes too weary. Almost everyone knows what a painful feeling comes when he stays up just an hour or two too late. The extra hour or two seem to do more harm than the sixteen that went before them. All of which comes under the head of excessive strain; and excessive strain is exceedingly harmful to the human system, particularly to the heart.

Human beings have always had the ability to reach out in the dark, as it were, and lay their hands upon wisdom, even when they did not quite understand the wisdom after they had laid hold of it; and they have done this in the matter of the danger of excessive fatigue.

How many generations of women have been told that "beauty sleep is what you get before 12 o'clock"? If there had not been some truth in this statement it would not have persisted throughout so many generations. The grain of wisdom in it lies solely in the fact that if one retires an hour or two before midnight he is more likely to avoid excessive fatigue. The "Early to bed and early to rise" rhyme was also apparently based upon the knowledge, gained from experience, that the last two hours of a long day are the hardest to endure.

Taking a Nap in the Middle of the Day

When Edison invented the electric light and noted the phenomenon that later led to the radio, he swept into the ash can all of the old couplets about going to bed with the chickens and rising with the lark. Even if it shall kill us, we are never going to bed early again; early in the old sense which, on the farm, meant 7 or 8 o'clock in the evening. There is too much going on in the evening and too little from 4 to 7 o'clock in the morning. Even farmers' families now sit up and listen to music, thousands of miles away, until long after midnight. I sit in my home on the Hudson above New York and hear a station in Miami, Florida, read telegrams at midnight from farmers in Maine who pay to a telegraph company the price of a bushel of potatoes to let the Florida station know that the "concert is coming in fine on the loudspeaker," or to ask if some of the Florida climate cannot be sent to melt the snowbanks of Maine.

We are not going to stay up until morning, but we are going to stay up awhile—too long to get much beauty sleep or health sleep before midnight. Since such is the fact, it is highly necessary that we understand the basis of solid truth that underlies the old admonition about the superior value of sleep gained before midnight. Edison has this basis and builds his house of health upon it. What we need to do is to form the habit of sleeping a few minutes before we have opportunity to become overtired; taking two or three cat naps between morning and midnight, and then lying down for about seven hours of good sleep. Whoever has tried it knows what an enormous amount of rest one can get in 20 minutes during the day. One rises with the feeling that he is fit for anything.

Of course, it all seems very absurd now to talk about the rank and file of the population taking a 20-minute nap in the afternoon and another one early in the evening. Whatever is new is likely to seem absurd. But whatever is best can, within reason, be done. If it be good for Edison to take two naps during the 24 hours in addition to his night's sleep, why might it not be just as good for everyone else? And if the natives of semi-tropical countries can afford to shut down business for three hours during the heat of the day, and the English can afford to serve tea and cakes twice a day to their office employes, why, if it were considered advisable for the public health and happiness, might not ways be found to give everybody in the United States a half-hour's sleep in the middle of the afternoon?

It would not be necessary for stores to kick out their customers at 3 o'clock in the afternoon, close the doors and post signs thereon: "Quiet, please; we are sleeping." All of the clerks need not retire to their rest rooms at the same time. But it is not plain to me why the greatest factory in the world could not shut down for half an hour each afternoon and let each man sleep on the floor beside his machine. A soft floor will do for half an hour for anyone who is tired. Edison has slept on one many a time.

The people who live longest in this world are, as a class, those who take care of themselves. Taking care of one's self does not necessarily mean doing as most others do; it is more likely to mean not doing as most others do. But no one can take care of himself who does not get enough sleep, or who permits himself to drive on after the limits of safe fatigue have been reached.

Much Nonsense Written About Dreams

I asked Edison about dreams.

"I never have any," he replied. "I presume there has been more nonsense written about dreams than upon any other one subject. I do not know whether it is true or not, but I have read that Napoleon used to believe in them. There may have been rare instances where a dream foreshadowed something that later took place, but, in my opinion, most dreams are caused by nothing but auto-intoxication. If people would get the poison out of their systems and keep it out they would dream less and rest more.

"It seems almost as if the little peoples who constitute the cells of which our brains are formed become groggy from the poisonous fumes that circulate in the blood of auto-intoxicated persons. Perhaps something like that is sometimes the explanation of grotesque dreams."

Edison realizes well enough, however, that the last word will not have been said about dreams until the last word shall have been said about the laws governing the operation of the human mind. Strangely enough, the most important thing about man is that which we have begun to study last—his mind. We have been at it barely 20 years. We started late because it is, perhaps of all human subjects, the most baffling. A brain can be taken out and looked at, and a heart can be put on the scale and weighed, but the mind is invisible and can be touched only with one's imagination.

As much can be said about electricity, yet Edison and others have hitched it to the world's business and made it work. The rapid progress that is being made in the study of psychology gives reason to hope that the young men and women of today will, before they have become old, know a great many interesting things about dreams. Edison already knows, from his study of psychology, that the thoughts we repress in the daytime often bob up when we are asleep, sometimes a little twisted, but nevertheless the same thoughts. He also knows that worry and everything else that gives rise to troubled sleep is productive of dreams—usually unpleasant ones.

Some persons believe that, on rare occasions, the human soul quits the body for a time during sleep and returns to it before the body awakens. Such an explanation was once given to me of a dream that a friend of mine had, years ago. He dreamed that he was looking down upon himself as he lay upon his bed sleeping. He seemed to be merely an intelligence floating in air, and from the air he looked down upon his sleeping body. He saw himself as plainly as he ever saw anybody else. He saw the covers rise and fall as he breathed. The thing was so vivid that it awakened him.

Does the Soul Leave the Sleeper?

I asked Edison what he thought about this dream and the theory that the man's soul might have left his body for a time.

"Well," he replied, "I don't know anything about the soul. There may be such a thing but I have never been convinced of it. Is the man still alive?"

I replied that he was, though the dream occurred years ago.

"Well, you see there was nothing prophetic about it," he added. "Dreams don't mean anything, so far as the future is concerned."

Edison then commented upon the extreme rapidity with which the mind works when the body that contains it is asleep.

"You remember," he said, "the story told by DeQuincey, the opium eater. He balanced himself upon the edge of his bed in such a manner that he would roll off on the floor the moment he went to sleep. Yet in the brief moment that was required for him to fall from the bed to the floor he had dreams that covered great periods of time."

Edison sleeps but does not dream. He is deaf as a post (almost), but gay and happy because enough is always going on within his own skull to keep him entertained.

Fireside Chat With Forbes-Robertson

Great Shakespearean Actor Thanks Americans for Giving Him a "Rest"

By W. TEIGNMOUTH SHORE

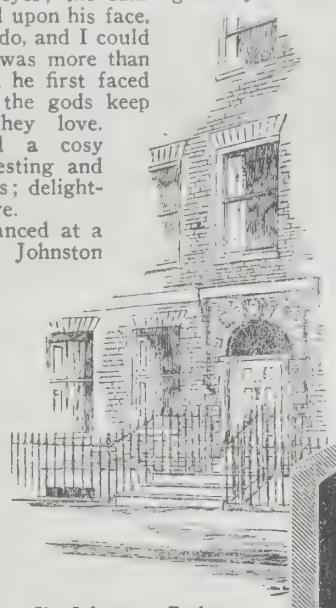
SITTING one side the hearth in the dining-room at his home in Bedford Square, London, I found it almost impossible to believe that my host, Sir Johnston Forbes-Robertson, was born in the year 1853. Never can there have been a younger old man; he appeared to me much the same as he was the first time I met and talked with him, I won't say how many years ago. The hair is tinged with gray and there are lines which are the footprints of time. Otherwise, what change? There is the same alertness; the same mellow voice; the same acute eyes; the same geniality. The sun streamed in full upon his face, as the limelight used to do, and I could scarcely believe that it was more than half a century ago that he first faced the footlights. Verily, the gods keep young those whom they love.

A comfortable and a cosy room; hung with interesting and often remarkable pictures; delightful, Old World furniture.

As I sat down I glanced at a capital likeness of Sir Johnston that hangs over the mantleshelf:

"There you are," said I.

"Yes, that was painted in San Francisco in 1885, when I was on my first visit to the States, playing lead to Mary Anderson; it's a fine, very fine bit of work; by an American painter, Collins, who died young. A very good piece of work. I've spent a great many happy years in America. For something like twenty years, from 1895 on, I was there almost all the time. They made me very happy there; such genuine kindness and true hospitality."



Sir Johnston Forbes-Robertson's house in Bedford Square.

Our conversation was vagabondish, switching from one topic to another as chance words or allusions led us; swopping yarns and memories of the past and now and again touching upon today.

"I was over in Germany in 1898, playing Hamlet and Macbeth at the Royal Theater, Berlin. It was very pleasant. The Kaiser was very friendly and cordial to me; I found him charming; a very cultivated man. Who would have suspected him of becoming what he did become? The same trip I went to Hannover—yes, it is a charming city—and to Hamburg, another beautiful place."

"Have you found any great difference between American audiences and ours?"

"Yes; I have. The Americans are quieter; not so demonstrative; very attentive. There's far less of that strolling in late and rushing out early that there is here; and no chattering. When I was a young actor it used to be very bad in London: I don't know what it's like now."

"I wish you did know," I said, "for our sake. I don't think, though, that things are much improved. I had my toes severely trodden on the other evening halfway through the first act, by a fat man who was annoyed because I was not pleased!"

"Yes, I found American audiences extraordinarily attentive; much more so than they are over here. In Germany, too, they were very good. The gallery and the pit here can be absolutely cruel. If Americans don't like you or what you're doing, they don't yell at you; they just freeze you with silence."

"Then it's a frost! Do you think the kinema or broadcasting will hurt the theater?"

"Unless very carefully controlled I'm afraid wireless may hit the theater—a bit. Especially in the country. It will take something wonderfully fine to get provincials out of their armchairs, when they can sit at home and listen to the best from London. Yes, it will have to be very carefully handled. The kinema—the pictures—well, I really don't know. Of course, there's always been a cry that the legitimate stage was being killed by something or other. But it's still alive! It used to be burlesque that was the villain; then it was musical comedy, and so on. But so long as the legitimate stage is true to itself it needn't worry about its rivals."

"The old Gaiety burlesques didn't hurt anyone," said I, "and they were awfully good fun. Not even when Teddy Royce burlesqued Irving so delightfully in 'The Corsican Brothers.'"

"Irving was sensitive to burlesque. He had many mannerisms that were easy to imitate; walk, voice, gestures, and so on. But he had great magnetism; you were compelled to watch him. He was a great man and could have made a name off the stage—he'd have been a fine prelate, or a successful diplomat: he was a wonderful judge of men. And so generous, so kindly, always."

"His funeral in the Abbey was very impressive."

"Yes; it was. I had a good deal to do with the arrangements. It was necessary to cremate him, because the Abbey authorities cannot dig deep, for fear of disturbing the concrete foundation. By the way, one of the French actors, Le Bargy, I think, representing the French theater, came ready prepared to deliver an oration over the grave—as they do in France—but the Dean would not allow it, which I think was a pity."

Somehow or other we skipped over from London to Dublin, and I reminded Sir Johnston of the story told of one of Irving's appearances in that dear, dirty city on the Liffey. At the end of the performance the great actor delivered one of his elegantly phrased speeches of thanks. Laying his hand upon his heart, he said: "I would I had a window in my chest that you could see the feelings of my heart." A kindly voice

Johnston Forbes-Robertson.

from the gallery inquired: "Ah, sure, and wouldn't a pane in your tummy do as well?"

"The Irish audiences are full of fun and wit," said Sir Johnston, "I remember an amusing story about Helen Faucit,* when she was playing in Dublin. It was the gossip that Sir William Wilde—his wife you remember was known as Speranza, the Irish poetess—the father of Oscar Wilde, admired Miss Faucit with considerable ardor. At the theater one night it was obvious that his emotions were very deeply stirred by her acting, and a voice called out: 'Don't cry, Willie, she'll have you yet.'"

"Now I'm going to ask you a very personal question. Who is the actress you best liked playing with; who helped and inspired you most?"

"My wife," was the prompt reply, "Gertrude Elliott, you know—"

"Yes, I know, I knew her before you did. Sister of Maxine Elliott."

"Yes, she's been my best partner on and off the stage. I first acted with her in the stage version of Kipling's 'The Light That Failed,' she was Maisie and I was Dick Helder. Then long after she was Cleopatra to my Julius Caesar, in Bernard Shaw's play, which he wrote for me."

We got talking about the place held by acting among the arts:

"It holds a high place, I think," said Sir Johnston. "I can't agree with those who say that it's not really an art. Higher than that of the instrumentalist and the singer, who interpret music, which is comparatively simple. But the actor does not, as is often said, actually create a part; but he does—what shall I say?—well, he often *adds* a great deal to it. I'm not talking, of course, of the average modern play, in which there is little character drawing as a rule, but of the great dramatists. The actor's mentality, his personality, his physical gifts or defects, count for a lot, come in so much. What? Oh, yes, a great part, Hamlet for example, grows as one acts it again and again; you're always finding something new, something more, getting some new light. Dramatists? Bernard Shaw? He's delightful to get on with in every way. Have you seen Saint Joan? Not! Well, you go! It's wonderful. The epilog and the tall hat and frock coat? Why, I find it uplifting, stimulating. It has impressiveness and great nobility. And amazing justness and insight. He sets the point of view of the Catholic church, and that of the feudal lords, fairly before you; makes the best of their cases; absolute fidelity to truth; no prejudice. There's one scene where three men sit round a table, twenty minutes or more, talking, never moving; but it holds you tight. A very great play; you *must* see it."

"Shaw's a bit of a martinet at rehearsals?"

"He's kindness and helpfulness itself; and tact. I've known most of the great producers, as they call them now, Charles Reade to Bernard Shaw; Shaw's the best of them all. He knows exactly what he wants and exactly how to get it. Charles Reade? A wonderful man. Hot-tempered, warm-hearted, very kind. I first met him when he engaged me to act in his play, "The Wandering Heir." Mrs. John Wood, a most lovable and beautiful character, with just a touch of the beauty of devil in her, and that fine old actor Edmund Leathes were playing the leading parts, which Ellen Terry and I took up when the play went on tour. What an actress!"

"I shall never forget Ellen Terry, Irving and you in 'Much Ado About Nothing' at the Lyceum; in 1882, I think."

"Yes; it was a splendid production. Ellen Terry and Irving drew out the very best from each other then. Yes, you're right, I painted for Irving a picture of the famous church scene. It's in the Players' Club in New York now."

"The Players'! Isn't it a delightful place?" I said, memories crowding in of many joyous hours spent there in the long ago. "It was Joseph Jefferson's house, wasn't it?"

"No, no; Edwin Booth. He bought the place and filled it with beautiful and interesting things—lived on the top floor himself—and gave the rest to his fellow players. He was a charming man as well as a great actor, and not a bit spoiled by his popularity. Yes, indeed, I owe a lot to America; many splendid friends and—it is entirely thanks to the American playgoing public that I was able to retire when I did, and—rest."

Bedford Square, London. (A typical old-fashioned London Square

"There's Lady Forbes-Robertson," I said as I looked at a charming portrait on the opposite wall.

"Yes, painted by Hugh Riviére, son of Briton Riviére, the famous animal painter." As I drew his attention to a striking portrait, painted with vigor and grip, he explained: "That's my father, John Forbes-Robertson, the art critic. I painted it—"

Then—at any rate on my side—a most reluctant "Goodby."

* Afterward Lady Theodore Martin. She acted with Macready in many of his Shakespeare productions.

World Cotton Control by Sapiro Plan

Evidence That Many Minds Worked Together to Tie Up Farmer

PROPONENTS OF THE SAPIRO PLAN OF Cooperative Marketing have declared that there is no connection between the cooperative associations organized under this plan by Aaron Sapiro and the international ring of Jewish bankers who control the money of the United States. Herewith is presented the confessed scheme of a Jewish banking corporation of New York to take over the cotton crop of Texas through the Sapiro Plan Cooperative Marketing Association there, control that crop and market it.

It is a strange coincidence that the manner in which they propose to do this is precisely the method by which the cotton-futures gamblers can make the most money. Here is proof of the statement previously made in these articles that the Sapiro Plan of Cooperative Marketing is merely a scheme whereby the international banking ring may come into control of the agricultural wealth of the United States.

By ROBERT MORGAN

THE Associated Press carried, October 10, 1924, an illuminating dispatch beginning as follows:

"NEW YORK, Oct. 9.—Financing of a large percentage of the cotton crop handled by the Texas Farm Bureau Cotton Association again will be undertaken by a banking group, headed by the Seaboard National Bank, and Goldman, Sachs & Co., by means of a revolving credit, not to exceed $10,000,000 at any one time, it was announced Thursday. Banks in San Francisco, Chicago, Philadelphia, Providence, R. I., and Houston and Dallas, Texas, are members of the group. The association, which was financed last year in the same way, expects to handle more than 200,000 bales of this season's crop."

On the day before this dispatch was printed by the newspapers of Texas, Henry I. Bowers, a member of the private banking-house of Goldman, Sachs and Company, appeared in Dallas, making the announcement, through the press of that city, that these Jewish bankers, *who are members of the stock and cotton exchanges,* would finance the Texas Farm Bureau Cotton Association to the extent of a loan of a "revolving credit" not to exceed ten million dollars.

The Texas Farm Bureau Cotton Association is organized and operated on the Sapiro Plan, and is tied up with the Texas Farm Bureau Federation. Aaron Sapiro provided the plan, the method of organization, the legal advice, the coöperative law which the Texas legislature passed, and, up to October 16, 1924, was intimately connected with the association.

We have thus presented to us in Texas the clearly defined picture of a firm of Jewish bankers, prominent members of the international financial ring, lending money to a coöperative agricultural marketing association organized, dominated and directed by a Jew. None of this money is to go to the aid of cotton-growers who are not members of the Sapiro-controlled Texas Farm Bureau Cotton Association. The cotton-planter of Texas who is not a member of this association cannot get money from any of the banks that are in this scheme; he cannot get money from any banks which are dominated by the Jewish banking ring; he cannot get money from the government with which to hold his cotton until he is offered a fair price for it.

I have said that the cotton-planter cannot get money from the government with which to carry himself and his cotton until such time as he can get a price for it which will pay him a fair return on his production costs. Lest there be any doubt as to the truth of this statement, allow me to quote from an address by W. B. Yeary, secretary-manager of the Cotton States Protective League, delivered at Midlothian, Texas, July 5, 1924:

> "When the Reserve Banking system was established, the law said the reserve banks must rediscount notes of member banks given them by their customers and adequately secured. The agents of the Reserve Banks publicly announced that there was no better collateral than cotton, and if the farmers desired to market it slowly, or to hold it for better prices, and wished to borrow money on it to do these things, if the member bank to which the farmer applied did not have the money, the Reserve Banks would be glad to take up the note, rediscount it, and carry it. This made every member bank able to aid farmers to do as the manufacturer, the merchant, the public-service corporation and others had been doing and still do. This was the cotton-planter's first opportunity to be a free man since the Civil War. * * *
>
> *"But—Wall Street cotton gamblers and banker gamblers went to Congress in the spring of 1920 and asked for an amendment to the bank act which would permit Reserve Banks to refuse to rediscount notes for 'purely speculative' purposes, in order—these gamblers said—that they could check speculating in stocks and bonds.* Congress amended the act as requested by the Reserve Bank Board.
>
> This board met at once and defined farmers holding their staple farm products for a price as 'purely speculative,' and notified member banks that *they would not rediscount notes secured by cotton* if the cotton planters were holding that cotton for a better price, as it was 'speculating' for the farmer to do this. If this amendment ever was applied to stock and bond speculation, no one ever has heard of it."

Thus, by means of the Sapiro Plan and of the refusal of the Reserve Bank Board to lend money to the cotton-planter on his crop, the Jewish banker has come into control of a large part of the Texas cotton crop. But before we consider further the position of the Texas cotton-planter, let us look for a moment at the details of this "revolving credit" into which the Sapiro Plan association has led its members. Quoting again from the Associated Press dispatch which I mentioned at the beginning of this article:

"The new agreement provides that credits under it shall be made available through acceptance by members of the bank groups of drafts drawn by the Texas (Farm Bureau Cotton) Association. These drafts may be drawn up to May 1, 1925, the maximum total amount that may be outstanding at any one time being limited to $10,000,000. All drafts drawn under the agreement will mature not later than July 1, 1925.

"The American Exchange National Bank of Dallas is trustee of the group. Cotton in shipment to or stored with the Houston Compress Company, of Houston, or other warehouses approved by the managers of the banking group, will be security for the credits.

"The orderly marketing of the cotton crop is provided for, the Texas Association having agreed that, so long as there shall be outstanding any drafts under the agreement, all the cotton acquired from its members during the 1924-25 season will be sold at a minimum average monthly rate of 10 per cent of its estimated cotton receipts for the season."

The italics in this last paragraph are mine. The Associated Press does not emphasize its statements because it does not consider it a part of its duty to warn farmers of this country of the pitfalls laid for them. To this open confession of the close connection between the international banking organization and the Sapiro Plan coöperative associations, Mr. Bowers, member of the firm of Goldman, Sachs and Company, as mentioned above, adds the following:

"After having seen the various branches of the cotton coöperative at work in Texas, I return to report in New York that I am one hundred per cent satisfied and pleased with the efficient management, soundness and good faith of *one of our most successful customers.*

"Cotton coöperation in Texas has sold cotton orderly, according to its expressed purpose during the past few years, when *the individual might well have held for higher prices and a bank would not have blamed the holder.* But to do so, even at a seeming advantage, would have violated one of the sound principles upon which coöperation is founded, and, of course, I am most favorably impressed with this evidence of the good faith of this farmers' organization."

Again, the italics are mine, and I must add that no matter how favorably impressed Mr. Bowers and the private banking house of Goldman, Sachs and Company find themselves, the spinners of cotton and the future gamblers in cotton are even more favorably impressed, for the whole scheme is one whereby these bankers, these spinners, these cotton exchange gamblers benefit, and the farmer, as is usual in the Sapiro Plan coöperative marketing associations, holds the sack.

Shortly after the Intermediate Credit Banks were established, the secretary-manager of the Cotton States Protective League wrote to Eugene Meyer, Jr., then managing director of the War Finance Corporation, asking him how and for what purposes loans would be made on cotton and other staple farm products. To this inquiry, Mr. Meyer replied:

"You will note that the Corporation is authorized to make these advances only for the purposes of affording emergency relief in connection with the raising and marketing, *in an orderly manner,* of agricultural products and livestock. It is not empowered to lend money under any circumstances for the purpose of holding products in anticipation of an advance in price."

Just why any cotton-planter should wish to borrow money on his cotton except "for the purpose of holding it in anticipation of a rise in price" is not clear, but here we have Mr. Meyer, another Jewish gentleman, aligned with Mr. Sapiro to support the "orderly marketing" shibboleth of the Sapiro Plan coöperatives, and trying to compel the planter to dump his cotton when, to whom, and at whatever price the agents of Sapiro command. On the other hand, we find Messrs. Goldman and Sachs, and other members of the ring of international bankers, quite ready and willing to lend money—which should be provided by the Intermediate Credit Banks through the Reserve Bank System—exclusively to those cotton planters who are members of the Sapiro Plan coöperative associations. This money, as advised by Mr. Meyer, is to be loaned only for "orderly marketing," that is to say, for the unloading of 10 per cent of the cotton handled by the Texas Farm Bureau Cotton Association each month, so that the spinner may be assured of the lowest possible price all the year round, so that the cotton-futures gambler may have his way made clear for him, and so that the Jewish banker may draw interest from the farmer as a reward for compelling that farmer to sell the product of his labor at little or no profit. It is as reasonable that the farmer should have the right to refuse to sell when the price is too low as the spinner to refuse to buy when it is too high.

It would seem to be a pertinent question to ask why the spinner, the speculator, the cotton-futures gambler should not pay this interest, instead of the farmer, but, in the Texas Farm Bureau Cotton Association, Sapiro Plan, as in other similar organizations, the farmer is the last man to have anything to say regarding the disposal of his own property. It is as reasonable that the farmer should refuse to sell as that Mr. Meyer should refuse to give him credit.

The Texas Farm Bureau Cotton Association was formed late in 1920, as a direct offspring of the Oklahoma Cotton Growers' Association, first of the statewide Sapiro Plan cotton associations, which came into being in June, 1920. Texas produces approximately 25 per cent of the cotton crop of the United States. In 1919, when cotton sold at 29 cents a pound for December in New York, immediately following the World War, with the visible supply placed at 4,817,000 bales, an estimate placed the 1920 crop at 12,500,000 bales. As a matter of fact, the 1920 crop totaled 13,879,916 bales, and

(*Concluded on page 15*)

World Control of Cotton is now a fact of Jewish enterprise. This article indicates how it is done. Another bit of evidence comes from Europe. In February, this year, the British Government was considering legislation that would exclude from Britain multitudes of alien Jews now swarming there. In protest against the proposed legislation, Nathan Laski, J. P., told the Home Secretary the following facts about *Jewish control of the British cotton industry.* He said that 90 per cent of the Indian cotton trade was in the hands of Jews. That 95 per cent of the Egyptian cotton trade of Manchester was in the hands of Jews. That 98 per cent of the Near East cotton trade was in the hands of Jews. That 99 per cent of the Constantinople cotton trade was in the hands of Jews. That all of the Syrian and most of the Moroccan cotton trade was in the hands of Jews. That 50 per cent of the cotton trade with South America was in the hands of Manchester Jews. That the Bradford export system was introduced by German Jews and is now controlled by their descendants.

These statements were made by a Jew as an argument that the Jews are of great benefit to Great Britain and, therefore, should be allowed to come in any numbers.

The old Mississippi River steamer *America* carrying a record load of cotton from the plantations to New Orleans for sale.

Baled cotton waiting to be passed through the compress shown in the background to be made more compact for shipment.

What Has Happened to the Pacific?

Sea of Peace No Longer—New Dangers Arise

By HARRY H. DUNN

WHAT has happened to the Pacific Ocean? Prior to September, 1923, that is to say, before the great earthquake which nearly wrecked Japan and shocked the whole civilized world, the Pacific was the most tranquil, as well as the most dependable of Neptune's gardens. The shipmaster, clearing his boat from San Francisco or Hongkong, Manila or Iquique, knew with certainty just what currents would carry his hull, what winds would fill his sails, and just where he would encounter both currents and winds. Today, much of this certainty has been replaced with mystery. New and strong currents appear suddenly, unexplainably, either flowing in directions contrary to known currents, or converting formerly quiet bits of sea into millraces. Points of rock are found to have risen where only deep bottoms existed a year ago. Shoals have piled up at harbor mouths where ample channels are marked on all the charts, and old shoals have thickened until, in some instances, they have formed small islands and bars.

Pack ice and huge floes, as well as the largest bergs ever seen in the Pacific, appeared suddenly far to the south of their usual limits in the North Pacific, and far

Coast-guard cutter *Bear* in the ice off Point Barrow, in the Arctic. Officers of the *Bear* report icebergs farther south and in unusual positions to which they appear to have been carried by new currents in the Pacific Ocean.

to the north of their regular range in the South Pacific. Trading ships, whalers, fishing vessels and coast-guard cutters, from both Japan and the United States, have been compelled to pass the winter of 1924-25 frozen in where before had been clear water. The coast-guard cutter *Bear,* heroine of more than a score of summers in the Arctic, reports ice farther south, as well as thicker and more closely packed ice fields, than ever before in her log. Icebergs of large size appeared in the harbor of the Pribilof Islands, a spectacle not remembered by even the oldest Indian in the islands. In South American waters, heavy icebergs appeared as far to the north as the fortieth parallel, according to reports to the Chilean Government. Pack ice has been heavier in the Strait of Magellan in the winter of 1924-5 than ever before since steamships, using this dangerous waterway, have been keeping records of its conditions.

Along the Pacific coast of California, Lower California, Mexico, Guatemala, Salvador, Nicaragua, Costa Rica, Ecuador, Peru and Chile, new and strong currents, setting toward the land, have been reported during 1924. These currents never have been reported before, and set directly across the known currents—which are parallel to these coasts—apparently taking in some measure the place of these north-and-south currents. Scores of wrecks have been recorded in the past year on the Pacific coast of the United States and Central and South America, virtually all of them attributed to new and uncharted currents, which never before had bothered navigators in these waters.

Similarly, new currents have appeared around the Hawaiian Islands, in the sea near Tahiti and other islands of that group, and particularly in the northern waters of the Philippines. New shoals and bars have appeared in the mouths of Chinese rivers, and Australia reports a notable decrease in the depth at the entrances to some of her harbors. Marine experts, navigators and harbor masters of the Island Continent have not been able to offer an explanation of these changes, other than to refer to them as "results of the Japanese earthquake." Navigators who have been in the habit of following certain well-charted "paths" along both coasts of the Pacific, and setting their courses across it, according to supposedly well-known currents and winds, now have to pick their ways at certain spots on both the eastern and western shores, follow new channels into certain harbors, and keep constant watch, when on the high sea, for new currents which have borne some ships many miles off their courses.

Reports from the masters of more than 300 vessels to the governments of the United States, Australia, British Columbia, Japan, Chile, Peru, and other Central and South American countries show that the western ocean has become, within twelve months, a puzzle to mariners. It appears to have changed from the most "pacific" of seas to the trickiest, since the Japanese earthquake in September, 1923. The hydrographic survey, and the coast and geodetic survey, of the United States Government are now working on new charts of the bottoms and currents of coastal waters on the Pacific. Similar departments of the Australian, Japanese, and Chilean governments are engaged in the same operation, but so far the deep-sea charts are being changed by the various transpacific shipping companies only on the reports of their master mariners as to new currents, new winds, and new shoals.

To the setting up of new coastal currents was due the wrecking of seven American destroyers, with damage to four others, on the rocks at Point Arguello, on the coast of Central California, on the night of September 8, 1923. Such new "streams in the sea" are charged with the crashing of the Pacific Mail Steamship Company's steamer *Cuba* on a reef off San Miguel Island, also on the California coast, at approximately the same date. The *Cuba* was a total loss, as were seven of the destroyers, but the crew of the freighter and some two million dollars in gold in her strong boxes were saved. The steamer *Concepcion,* belonging to a South American corporation, was wrecked on the rocks off the port whose name she bore, in Chilean waters, by another new current, set up, overnight, as it were, by the disturbance which wrought so great a change in the Pacific.

These were merely outstanding disasters due to the new currents, the upthrust of new shoals and reefs, and, in northern waters, to stronger winds and greater ice fields. According to all the reports to which the writer has access, there were 147 accidents to shipping on the Pacific in the year between September 1, 1923, and the same date in 1924. By accidents, I mean disasters which were attributable to the elements only, and not to mistakes of navigation or other human errors. Remarkably few of these resulted in loss of life, but the majority did present heavy property damage.

Indications are that the greatest change in oceanic currents due to the Asiatic seismic disturbance is an alteration of the regular, well-charted north-and-south currents, to east-and-west currents, that is, eastbound on the American side of the Pacific, and westbound on the Asiatic side. This means that currents which hitherto bore ships safely alongside these coasts, now tend with powerful thrusts to throw vessels on the land. As an old shipmaster, who for more than fifty years has operated a sailing vessel on the Pacific, said to the writer:

"I used to know every course on the Pacific; now, I don't know where I am going or when I'll get there."

The old north-and-south currents remain, but appear

Fur-trading vessel caught in the ice far south of the usual range of heavy ice on the Alaskan coast, in 1924, and compelled to remain in the North all winter, for the first time in her history of more than twenty years in the Arctic.

to have been either submerged, or to have lost their former strength and volume. Even the Japan Stream is believed to have been altered to some extent by the disturbance in the floor of the Pacific. A tidal wave, probably born in this wide "river in the ocean," swept a limited section of the west coast of Lower California, early in September, 1924, about a year after the Japanese earthquake, doing heavy damage to the town of San Jose del Cabo, causing some loss of life and destroying a considerable quantity of small shipping. This wave is now believed to have originated in a further sinking of the sea bed, following the deeper and more widely spread sinkings caused by the Asiatic quake.

According to Captain T. J. J. See, director of the United States Naval Observatory at Mare Island, California, the Japanese earthquake was caused by the seepage of water through the bottom of the Tuscarora Deep, due to tremendous pressure, and the impinging of this water on the molten magma of the earth beneath the crust of this globe. The Tuscarora Deep, a submarine gorge off the coast of Japan, was known to be more than five miles in depth, prior to the Japanese quake. Less than a year after the quake, the Japanese warship *Manchu* failed to find bottom with a line six and one-quarter miles long, or about a mile longer than any line ever before needed to reach the bottom of this great canyon in the sea floor. With this tremendous movement of the submarine crust of the earth, the Pacific Ocean changed overnight into the greatest of the world's marine mysteries.

If, on the other hand, the Japanese earthquake was caused by a slipping of a mile or two in the sloping floor of the sea, as suggested by Dr. A. C. Lawson, head of the geological department of the University of California, instead of by submarine seepage, as Captain See claims, the result to the remainder of the Pacific, both the bed and the surface, would be the same. Both scientists attribute the strange changes in currents, climate, winds, shoals, and other formerly well-known phenomena of the western ocean to the Asiatic seismic disturbance, irrespective of what may have been the original cause of the earthquake.

It is believed, by these and by other seismologists and geologists, that the changes in the Pacific were not caused entirely by the one quake which shook Japan with such force. They believe that there were a number of submarine earthquakes, possibly eruptions of sea-buried volcanoes, and similar disturbances, in both the Northern and the Southern Pacific, following the Japanese temblor. Some fifty captains and mates on ships plying the Pacific have reported localized disturbances which they felt as earthquakes, while their ships were at sea. These disturbances, according to a series of reports made by captains of merchant ships to their companies, seem to have followed two rather distinct belts across the Pacific. The more southern of these belts seems to extend from the Equator southward to about the thirtieth parallel, approximately the latitude of Sydney, Australia. This belt is thus some 30 degrees in width. The northern belt appears to extend from about the fifteenth parallel of north latitude, near which line Manila is located, northward to the sixtieth parallel, which passes through Bering Sea. Thus, the northern belt is some 45 degrees in width, or rather more than half again as wide as the southern belt.

Indications are, though official reports of the soundings are not available, that the great trench in the bottom of the Pacific off the coast of Peru and Chile has deepened considerably since the Asiatic earthquake. Tidal waves have been reported from this coast, with some landslipping in the coastwise Andes, and a wide range of changes in the currents alongshore. Twelve new currents, virtually all of them setting inshore, have been reported to the Chilean and Peruvian governments, according to official reports of masters of British and American and

(*Concluded on page 6*)

Five of the American destroyers as they appeared laid on the rocks at Point Arguello, on the California coast, shortly after the Japanese earthquake. New and uncharted currents of tremendous power, set in motion by the Asiatic seismic disturbance, are believed to have been responsible for this disaster to the destroyer fleet.

Postal Men Get Increase

Bill to Provide Funds Also Raises Postal Rates

By BURT M. M'CONNELL

IN THE passage of the Postal Bill a victory has been won for a principle which has been compromised somewhat on its application. Last year, it will be recalled, the President vetoed the bill for raising the salaries of all postal employes in the classified service. He conceded the point that the high cost of living warranted higher salaries but felt obliged to veto the proposed increase because the bill did not provide the money for it, amounting to some $68,000,000.

Soon after Congress convened last December it began to play football with the Postal Bill, while Post Office employes, from the Goddess of Liberty to Puget Sound, trudged through blizzards to deliver the mail. The Senate failed to pass the bill over the President's veto. Then it wrote a bill of its own, fully aware at the time that all revenue-raising legislation must originate in the House of Representatives. The House properly rejected this measure, and adopted the Kelly Bill. The Senate amended the House bill, and substituted its own rates—which would have raised perhaps half the revenue needed. The House rejected this, also. Finally, when it seemed that Congress would adjourn without taking action on the Postal Bill, several conferees from the Senate and House met behind closed doors and evolved a measure that not only provided for increased postal salaries but for higher rates on virtually everything except first-class matter. This was satisfactory to the Senate, the House, and apparently to the President, for he signed it. Or did he realize how utterly impossible it was to expect anything better from Congress?

Thus culminates a fight for higher pay, begun several years ago by postal employes when the increased cost of living bore heavily upon them. The added expense to the nation will be approximately $68,000,000 a year. At the time the bill was passed, it was estimated that of this amount, about $60,000,000 would be raised by increasing the rates, but while Congress made the new rates effective for only eight months of the calendar year, the salary increases are retroactive to January 1.

On this basis, the additional revenue for this year will probably not be more than $40,000,000; the balance of $28,000,000 necessary to pay the increased salaries must come from other funds in the Treasury. But there is no widespread complaint from the public, now that this great army of underpaid workers has received an average raise in salary of $300 a year. Heretofore the inadequate pay not only has been a hardship on the postal employes, but in various ways it has operated as a handicap to the service. Seldom, if ever, in the history of this country has there been such a show of public opinion in favor of a similar claim. Practically everybody agrees that postal employes have for years been entitled to more pay. The chambers of commerce which opposed the measure probably did not realize that this $68,000,000 will be spent for food, clothing, homes, automobiles, radio sets, marriage licenses, and so forth.

The Postal Bill is only a temporary measure. It is a compromise; a makeshift. There is no pretense that the rates are equitable or scientific. In fact, the old rates may be restored within a year, while the increases in salaries remain. But whatever the results of the new rates may be, there will be general satisfaction now that postal workers are to receive less niggardly treatment at the hands of the greatest business organization in the world—the United States Post Office. Meanwhile, a special joint committee of Congress is to work out a permanent schedule of rates before Congress meets next December.

A considerable portion of the additional revenue is to be raised by higher rates on parcel post matter. This has the farmer, who ships his butter and eggs to customers by parcel post, up in arms. While the parcel post service was established for the farmer, the Post Office Department has ascertained that less than 10 per cent is so employed. The new rates, therefore, will not be a burden on this class of mail users. Besides, the farmer and other users of this service should remember that it has been responsible for a portion of the Post Office Department's deficit, and that even under the higher rate, parcel post matter will be carried at lower rates than express matter. The general public, in adjusting itself to the higher charges, should remember that postal rates have hitherto been virtually at the prewar level, while there has been an average increase in the cost of almost everything else of at least 60 per cent

The Post Office Department, like Topsy, has "just growed." In 1900 the department spent $107,000,000. Last year its expenditures were $567,000,000. Much of this tremendous increase is due to the constantly increasing expense and the various forms of service, voluntarily undertaken by the government without regard to cost, in an effort to be of greater service to the people.

For example, the sole purpose of the Rural Free Delivery system was to benefit the farmer. No one imagined that it would ever pay for itself. The cost was assumed by the government in the same spirit that it assumed the cost of river and harbor improvement, of state aid in the building of highways, and the creation and upkeep of National Parks. In this case, it was a donation to the agricultural interests. The first appropriation for this service, twenty-seven years ago, was $40,000. Last year the Rural Mail Service cost $87,000,000. Yet, while the parcel post runs up a deficit of approximately $30,000,000 a year, and the Rural Mail Service costs $87,000,000, no one wants to see either service abolished. They are a great aid to the rural districts. Business is helped, and the country generally approves of this form of indirect taxation.

Although a committee will endeavor to fix equitable and scientific postal rates before Congress meets next December, this will be difficult, if not impossible, unless the Post Office Department adopts a businesslike system of conducting its vast operations. At present, the department performs services for other governmental departments and Congress for which it receives no revenue whatever. Last year, according to the Postmaster-General's report, these services were performed at an expense of $13,000,000. There is no one feature so much abused as the franking privilege. Senators and Congressmen actually send out hundreds of tons of campaign speeches and other political documents each year. Not only are these franked speeches transported at the public's expense, but the taxpayers of the country are called upon to pay for the paper and printing. There are hundreds of tons of other documents, a large percentage of which are never even opened, franked out of the government departments each year.

An analysis of the department's operations shows that in addition to its losses on purely business transactions, such as special delivery, postal cards, money orders, and so on, there is lost each year from $6,000,000 to $20,000,000 on free delivery of newspapers within county limits. Approximately $27,000,000 is lost on foreign mail and special mail services, and last year the department spent $10,000,000 promoting star routes. With the $87,000,000 expended by the Rural Mail Service, this makes a total of more than $140,000,000. Had many of these public services been performed by the Department of Agriculture, the Department of the Interior, or any other department of the government, they would have been paid for out of the public funds, but having been performed by the Post Office Department, they were paid for almost wholly out of postal revenues.

In view of the above, the real question seems to be whether the increased cost of operations in the Post Office Department is necessary. This will be decided by the joint committee heretofore mentioned within the next eight months. Meanwhile, the postal worker receives an increase in salary. Even with their present wage increase, postal workers are underpaid. Not one of them should be asked to work for less than $2,500 a year, if he is to keep himself and his dependents in comfort.

The chief salary rates of the new bill are:

Postmasters: first class, $3,200 to $8,000; second class, $2,400 to $3,000; third class, $1,100 to $2,300; Post Office inspectors, $2,800 to $4,500; Assistant Postmaster, second class offices, $2,200 to $2,500.

Under the new salary rate, clerks in first and second class offices and letter carriers in the city delivery service, who are divided into five grades, will receive salaries ranging from $1,700 to $2,100; railway postal clerks will now be paid from $1,900 to $2,700, and special clerks now earn $2,200 or $2,300. Laborers in the railway mail service receive $1,500 and $1,600. Rural mail carriers, who received from $720 to $1,800 a year, receive the same salary under the new bill but, in addition to the salary provided, the rural carrier, to quote the new bill, "shall be paid for equipment maintenance a sum equal to four cents per mile per day for each mile or major fraction of a mile scheduled." Also, "each rural carrier assigned to a route on which daily service is performed shall receive $30 per mile per year for each mile said route is in excess of 24 miles, and each rural carrier assigned to a route on which triweekly service is performed shall receive $15 per mile for each mile said route is in excess of 24 miles."

Village carriers are now paid $1,150 to $1,350. All pay increases are retroactive to January 1 of this year.

The new postal rates, which go into effect April 15, are as follows:

Private mailing cards and souvenir post cards, 2 cents each. The publisher's second-class mail rate on reading matter is the same as before—1½ cents a pound. The rate on advertising matter remains 2 cents a pound in zones 1 and 2, 3 cents a pound in zone 3, and 6 cents a pound in zones 4, 5 and 6. The new rate for zones 7 and 8 is 9 cents in both zones.

The new rate on religious, educational, scientific, philanthropic, agricultural, labor or fraternal magazines, not published for profit, to all zones for both reading and advertising matter is 1½ cents a pound.

Those who are in the habit of sending single copies of newspapers and magazines will find that the new rate of postage on publications entered as second-class matter, "when sent by others than the publishers or news agent," shall be two cents for each two ounces or fraction thereof for weights not exceeding two ounces, and for weights exceeding eight ounces, "the rates of postage prescribed for fourth-class matter shall be applicable thereto."

Third-class mail will not include merchandise, which formerly was fourth class. The new third-class rate is 1½ cents for each two ounces up to eight ounces, except on books, catalogs, seeds, and so on, not exceeding eight ounces, on which the rate is 1 cent for each two ounces.

All matter over eight ounces which is not included in the other classes is now fourth class. The basic rates remain as at present. The new bill, however, adds a flat 2-cent service charge to each package, and provides a "special handling" charge of 25 cents that is optional. This entitles such mail matter to the same expeditious transportation, handling, and delivery accorded to mail matter of the first class. There were no such provisions under the old law.

Changes have been made in money order, C. O. D. rates, and charges for special delivery packages.

McGuffey's Maxims

Little Tales of Conduct From the Famous School Reader of the Last Generation

THE CRUEL BOY PUNISHED

1. An idle boy was one day sitting on the steps of a door, with a stick in one hand, and a piece of bread and butter in the other. As he was eating his bread, he saw a dog lying near him, and called out, "Come here, fellow!"

2. The dog, hearing himself kindly spoken to, arose, pricked up his ears, wagged his tail, and came up.

3. The boy held out his piece of bread and butter, and as the dog was about to take it, the naughty fellow struck him on the nose with the stick, which he had in the other hand. The poor dog howled, and ran away as fast as he could.

4. The cruel boy laughed heartily at the trick he had played. At this moment, a man on the other side of the street, who had been watching him, called to the boy, and showing him a half-dollar, asked him if he would like to have it.

5. "Yes," said the boy, "to be sure I would." "Come and get it, then," said the man. The boy ran to him, and stretched out his hand for the money, when the man gave him such a rap over the knuckles with his cane, that he roared with pain.

6. "Why did you do that?" said the boy, grinning and rubbing his knuckles. "I did not hurt you, or ask you for money."

7. "Why did you strike the poor dog just now?" said the man. "Had he hurt you, or asked you for bread? I have served you just as you served him."

8. The bad boy hung his head, and seemed very much ashamed; and I have never heard of his playing any cruel tricks since.

What Has Happened to the Pacific?

(Concluded from page 5)

Japanese steamers plying to and from the ports of those South American countries. Extremely deep areas of the ocean usually are associated with nearby regions of mountainous land frequently disturbed by volcanic and seismic activity. These deep areas in the Pacific, for example, are along the coast of Japan, on the southward line of the Aleutian Islands, around the Philippine Islands, around the Hawaiian Islands, and off the west coast of South America, with a district of rather deep water off the coasts of Washington, Oregon, and California. The shores of all these so-called "deeps" are volcanic, and it is probable that the bed of the great Pacific Ocean, largest body of water on the globe, has undergone, and is even yet undergoing, a topographical change which is having a great but little-known effect on its currents.

The normal and well-known ocean currents, of course, constitute a system of circulation for the unequally heated waters of the sea, which also drifts in the same general direction as the great wind systems of the earth. The tides—which apparently have little to do with the ocean currents except in bays and river mouths—are due to the disturbing attractions of the sun and the moon, which cause two movements of the sea daily. Now, however, merchant ships crossing the Pacific, and approaching the mainland on either side, find themselves suddenly and unexplainably ten to twenty miles off their courses, their movements accomplished by uncharted currents in a few hours. The destroyers which went ashore at Point Arguello were at least five miles off their courses, and the steamer *Cuba* was some seven miles out of her course. These two disasters first called attention to the changes in the Pacific, changes which are of the greatest importance, not only to the merchant marine, but to the navies of the world as well as to the entire sea-borne commerce of the western ocean.

Mr. Ford's Page

IT IS frequently said that this is a rapid age, that we are living too fast, that the speed required of people today is destroying all the values of life. The impression is conveyed that the people of this generation are breathless, excited, nervously tense, and driven beyond endurance. It is conveyed by people who have a reasonably quiet sort of life, by professional men who write from the studious quiet of book-lined libraries, by reformers who possess no balancing experience with life at first hand.

Clear thinking would be greatly assisted if an analysis were made of the facts, from the angle of this charge of driving intensity. A summing up of the situation would yield something like this: more things are being done today than ever before, but they are being done in less time and with less effort and with a consequently wider margin of leisure for all the people.

Middle-aged people have seen a number of changes. They have seen the working day greatly shortened. The younger of us remember when 10 hours was the standard day. Those a little older can recall when the working day extended as long as 12 hours. And there are men alive today who lived when the working day was anywhere from 12 to 17 hours. In any portion you may select of "the good old days" for which people sometimes sentimentally yearn, the leisure allowed the working man was hardly enough for eating and sleeping. And yet the only verdict we get on the greater freedom, the longer leisure of men in the present time is the verdict that men are more terribly driven today than they ever were before, that they have less time to live, and that modern industry has robbed them of their human birthright.

Repugnant as it is to most of us, in this creative generation, to appeal to past records, it is sometimes necessary if only to give us the vivid background against which to estimate present conditions. The time we select is the year 1832, the place, the most socially enlightened at that time of any industrially developed nation, namely England. The occasion is the examination of certain persons in the British House of Commons. The conscience of the people was waking: the gaunt fact of industry without any admixture of the saving element of moral responsibility was making its way into sensitive minds. Among many, one Samuel Coulson was examined, and his testimony was simply a repetition of hundreds of others. He had children at work in the mills.

Q. "At what time in the morning, in the brisk time, did those girls go to the mills?" A. "In the brisk time, for about six weeks, they have gone at three o'clock in the morning, and ended at 10, or nearly half-past, at night."

Q. "Had you not great difficulty in awakening your children to this excessive labor?" A. "Yes, in the early time we had to take them up asleep and shake them, when we got them on the floor, to dress them, before we could get them off to their work; but not so in the common hours."

Q. "What was the length of time they could be in bed during those hours?" A. "It was near 11 o'clock before we could get them into bed after getting a little victuals, and then at morning my missus used to stop up all night, for fear that we could not get them ready for the time."

Q. "Were the children excessively fatigued by this labor?" A. "Many times; we have cried often when we have given them the little victualling we had to give them; we had to shake them, and they have fallen to sleep with the victuals in their mouths many a time."

Adults were compelled to work 16 hours a day at this period. It is almost unbelievable that men could be content to make such conditions for their fellow men, and equally unbelievable that human strength could withstand such conditions. Yet it did. People beginning in the mills at six or seven years of age, lived to long life there, and knew nothing else.

But reform came. It came through a better kind of business man coming in to organize the working day. The professional reformers, that is, those who talked about the badness of the existing conditions but were not possessed of sufficient managerial or business ability to change them, doubtless did their part; but the main part was done by business men, like Robert Owen, who saw that the method which the greedy employer regarded as good business was bad business.

That is one place where the whole philosophy of class war is wrong: it assumes that wrong conditions are the deliberate creation of managers. They are rather the proof of the lack of managerial ability on the part of managers. The remedy is not to do away with managers, but to get real ones. Every oppressive situation, in any sphere of activity, is due to a lack of organizing, directing ability. The mill managers of 1832 were just as sleepy in their minds as were the mill-hands of that period. It only needed the arrival of one or two wide-awake human beings, born managers, to give the whole situation a twist that changed it.

To anyone interested in the root-beginnings of these things, it is always wonderful to note that when what we call morality comes into business, it always comes by the gate of good management.

It seems, perhaps, that 1832 is quite a distance in the past. Yet, in point of achievement it is likely that the distance between today and 1932—or seven years hence—is really greater than the distance between this year and 1832, which is 93 years. And in a less period than that, indeed, in very recent years, the leisure of the people, the margin of life, has greatly increased.

And not only has the leisure increased, but the means to use and enjoy it. Empty leisure is not desirable from any point of view. Indeed one of the problems of the times, as many people see it, is the problem of leisure. The people have more spare time than they know what to do with. One of the recognized tests of character is the thing that a man does when he has nothing else to do, the thing he thinks about when his mind is free to roam. The time that is free from engagements of a pressing kind has greatly increased in extent, and goes on increasing. Yet with the increase of leisure, the great extension of spare time, there comes the plaint that we are living in a too fast age under a driving pressure.

With the facts concerning hours of labor before us, and the fact of increasing leisure open to all the people, the source of the sense of haste and pressure must be found elsewhere than in industrial conditions. It is altogether probable that the pressure is not that of labor but of ideas. People are thinking, can hardly escape thinking of more things today than entered the mind of the most alert and learned fifty years ago. The commonplace of daily thought now ranges through realms that would have seemed miraculous to the wisest man a few years ago. Wonders that would have turned the world upside down even 25 years ago are today accepted as new toys for amusement—witness the radio and flying.

It may be that this multitude of newness, this avalanche of wonder that has plunged upon mankind, has generated a nervous tension. And yet this seems hardly the true explanation since mankind seems to have developed a protective indifference to most of these things; mankind refuses to become overexcited about the greatest discoveries. Probably, however, the constant beat of unaccustomed ideas, the bewildering variety of them, the instantaneous method by which all, from the highest to the lowest, are made aware of them, has an effect, a cumulative effect, which we interpret as tension. The magnetism of the vast thinking mind has probably enthralled us more than we are aware.

A GENERATION that has more leisure than any of its forbears ever had is described as being too fast. A generation that makes its living more easily than any preceding one has done is described as being driven. How is this contradiction to be accounted for? Perhaps it is the steady beat of new ideas upon the mind. Perhaps it is the fact that more people are now free to do more things and are doing them. Whatever it is, people who have more spare time than people ever had before get the sense of whirlwind pressure, and repeat the common criticism that "we are going too fast." Yet people live longer than ever before, live with less effort, live on a higher plane. Is it possible that this common saying about our rapid pace is just another thoughtless mob-suggestion? Think it over.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Editorial Sense

"RECONSTRUCTION days are upon us, and the newspaper that makes its fight for right rather than circulation, for Americanism rather than communistic experiment, for character rather than sex slush, will find the great public rallying to its banner. That newspaper will prosper best which serves best."—*R. C. Snyder,* Norwalk (Ohio) *Reflector;* President Associated Ohio Dailies.

At first glance it seems that the famous curtain speech "that's all there is, there is no more" is applicable to Mr. Snyder's summarizing of the sphere of newspapers. He might have expressed one more thought, which, however, is implied: "and the editor who wants to serve best will say 'I am the public, what do I want to see in the newspapers?'"

Mr. Snyder's utterance is significant because he is the official representative of a press that has a tradition of influence and service. He speaks from a position of familiarity with both the business and editorial concerns of the newspaper. It is frequently the case that editorialists fail to understand the problems of the business office, and that circulation and advertising men fail to understand the ideals and principles of the editorial force. But this utterance has both sides in view, and the conclusion is that the paper which serves the enduring elements in the community is the paper that will be served by the patronage of the community.

This does not always *seem* to be the way it works out. The writer has in mind a city where the noisiest of the newspapers seems to be the most successful. Its red headlines and its shouting appeals are seen everywhere in the downtown district. Staid citizens shake their heads over the astonishing invasion of the journalistic field by this sheet which frankly assumes that men and women are interested only in the two or three elements of life which are capable of the greatest degradation. But the fact is, that paper is the only one in the city that is losing money. It seems to overshadow the whole field. But in reality it does not. Its only hope lies in spoiling the newspaper taste of a sufficient number of persons to make its work profitable.

But, a combination of editors on the plain platform of American decency, a declaration of independence against the wire propaganda that steals newspaper space for the dissemination of un-American ideas, a widespread editorial practice of newswriters in putting themselves imaginatively into the home to which their papers go, this would be sufficient to swing the whole situation.

It is intensely significant and highly promising that the President of the Associated Ohio Dailies should say with such forthrightness—"That newspaper will prosper best which serves best."

Is Great Britain Scrapping Free Trade?

IN EXPLAINING his new trade policy in the British House of Commons recently, Mr. Baldwin repudiated any suggestion that his government was departing from free trade. Nevertheless, free-trade Britain is clearly growing anxious. One of the first acts of the MacDonald government, it will be remembered, was to abolish the McKenna war measure, known as "The Safe-guarding of Industries Act." Mr. Baldwin in his recent election addresses, while emphasizing the fact that he would abide by the country's decision against protection over a year ago, announced his intention of introducing "analogous measures to help industries sore hit by unfair competition." These analogous measures have now been explained in a statement of policy issued by the Board of Trade.

The situation is a curiously interesting one. There is to be no revival of the Safe-guarding of Industries Bill, no blanket measure of any kind. The way of it is simply this: Any industry which feels itself sore pressed "by unfair competition" can appeal to the Board of Trade for protection. If the Board of Trade considers that the industry has a *prima facie* case it will appoint a small committee of disinterested persons to inquire into the matter and if this small committee reports back favorably to the Board of Trade, the minister of the Board will introduce a special bill into the House of Commons for the help of that special industry.

The result of this will be, that there will be no general debate in Parliament on the whole policy, as a policy. Debates will be limited to the case of a particular industry, and the whole question will be dealt with from an emergency point of view. The effect of such policy will be that no individual case will amount to a sufficient violation of free trade, so that the country will always have free trade even when it gets a general tariff.

Of course to say so much is to count without the overwhelming free trade sentiment throughout the country. In the difficult industrial period through which Great Britain is passing every great industry will, almost inevitably, be tempted to seek relief through an appeal to Parliament. This would mean a rapid succession of special bills, the consumption of a vast amount of parliamentary time, and the riveting of the attention of the whole country on the question of protection versus free trade once again. How long any government could last in the storm that would arise it is impossible to say.

Mr. Baldwin is counting upon the existence of several factors in his favor. The chief of these will undoubtedly be the trades union element in the parliamentary Labor Party and throughout the country. As a party, labor stands emphatically for free trade, but as trade unionists, any individual member of the party would find it difficult to oppose a policy, ostensibly temporary, which claimed to be the only way of salvation for the particular industry in which he was interested.

But the British Premier knows he must pilot his ship with care, for Protection was the rock on which it was wrecked little more than a year ago.

Aaron Again

SPEAKING in Temple Meshkan Israel, at New Haven, Connecticut, Aaron Sapiro said, concerning the articles about him in THE DEARBORN INDEPENDENT—"There are hundreds of uneducated farmers who believe every word of them. I know that to be true because I have overheard them talking of me."

"Uneducated" is good, coming from the Farmer's Friend. They may have been uneducated when they signed on Mr. Sapiro's dotted line, but they speedily learned a number of things.

The Spy

ACCORDING to a London message, three subjects especially occupy the attention of the spy today. They are aviation, poison gas, and naval designs.

These three things indicate the trend of research and discovery in modern war equipment. By the almost unanimous consent of the nations, the development of aircraft is the matter that is being most closely watched.

If anyone takes the trouble to keep an eye on the world's news, it will be seen that there is almost as much talk about one nation spying on another as there was in the months preceding the World War. So "jumpy" did certain countries become as to the system of espionage that was alleged to be going on, that there developed a state of nerves in some countries which caused some people to see airships cleaving the skies in the lonely watches of the night and strange men with fierce mustaches and foreign accents making sketches around fortresses or purloining blue prints from the shipbuilding yards.

To find out just what a potential enemy may be doing has become more or less of a fetish in modern times. But the nation that had the most perfect and baffling secret service in the last war was whipped. And the United States, which had hardly any such service, was able through its young men to get all the information it wanted.

After all, whether in peace or war, there will always be sufficient Might to defend the Right.

What About the Shoals?

MUSCLE SHOALS continues to attract public attention and inquiries are continually being received as to the present status of the big work. Mechanically it steadily progresses toward completion; but politically it is still a muddle.

Three occurrences of importance may be noted as having recently been brought to view. The first is that Congress, apparently apprehensive of what Secretary Weeks might do during the adjournment, passed a strong resolution urging the President not to permit the Shoals to become an adjunct of the power trust, and to that end recommended a commission of three members to guard the public rights in the Shoals. The second occurrence is that the President did not adhere to the recommendation as to the number to be appointed, and added two more for reasons which do not seem clear. So that there are now five members, with, it is said, Secretaries Hoover and Weeks hovering in the background as ex officio influences.

The recommendation of the House was made under the war-time power which the President still possesses to dispose of the Shoals, which power it was feared that Secretary Weeks might usurp for the service of the power trust when Congress was at home on vacation. There was clearly distrust as to what might be expected from that gentleman. The President should by this time be aware of the extent of his powers in the matter, and should prevent Mr. Weeks horning in too officiously.

Latest of all are dispatches from Washington which state that Secretary Weeks is again busy with bids and that he has authority to make arrangements for the use of power on 30-day revocable contracts. What all this means, insiders may well guess. It certainly seems to be contrary to the express intent of the House in its resolution to the President.

There are no bids for Muscle Shoals. Only one *bona fide* bid was ever made, and only one was ever considered by Congress. The rest were fog and camouflage, deliberate plays for confusion in hope of a day when a man with the corporation viewpoint, like Mr. Weeks, could do as he wished with the property. Muscle Shoals is already an accusing monument of political stupidity. It is due to become a much more serious accusation against politics if the Weeks plan of procedure obtains White House favor, as it seems now to be doing.

Is the Earth Too Small

THERE was once a man, says tradition, who worried himself to death because he read that the fuel supply would be exhausted in so many million years, and there are people today who give themselves no end of trouble about things equally remote.

Doubtless there are certain parts of the earth's surface where there are more people to the acre than there ought to be, but there are vast areas where men cannot be found.

On this continent, without going any farther, there are yet considerable areas that are lying idle or that are only partly developed, and in South America there are millions of square miles the possibilities of which have scarcely been scratched. In Brazil, for example, there are immense unexplored regions, the possibilities of which cannot yet be gauged. In the Argentine and in Mexico, countless acres, which are at present given over to the grazing of cattle, will in time be put under crop; and in Peru it is asserted that vast stores of copper lay hidden in the Cordilleras, millions of tons of timber stand in the forests awaiting the axe, while great quantities of oil are still untapped.

The great continent of Africa is also undoubtedly a land of the future. Cecil Rhodes' dream of a Cape to Cairo railway is not yet realized, but the work is under way, and hundreds of miles of country have been linked up.

It is increasingly being recognized that a more equitable distribution of the human race is desirable, but this must come about in a gradual and natural manner, not by any sudden disturbance of present conditions.

Settled

THE important assignment given to Brig.-Gen. Mitchell should do much to neutralize the harmful impression diligently made in recent months that the defense departments of the government penalize men who zealously endeavor to improve the machinery of defense. The Mitchell controversy might have been more effective than it was had all these matters of personality been avoided. The good that was achieved came in spite of it. With it now being clear that there is no desire to "punish" Mitchell, or to deprive the air service of his experience, a regrettable by-product of the recent discussion may be permitted to drop into oblivion. We Americans are grown too wise to make martyrs out of men who do their duty.

It Isn't Size or Build That Counts

Showing That the Davids in Sport Often Get Ahead of the Goliaths

Cyril Walker, weighing less than 120 pounds, lightest among professional golfers, won the 1924 open championship over a course where only the giants and their long drives were admitted to have a chance.

By PAUL MACDONALD

WHEN Paavo Nurmi arrived in this country Americans were astonished. They had expected to see a powerful athlete, a giant of a man, with big legs, a mighty chest and bulging shoulder muscles and biceps. What they saw was a man of ordinary size and build, a man who did not differ in appearance from several million men that live in the cities, towns, villages, hamlets, and on the farms of their native land. This young man from Finland, hero of the 1924 Olympic Games at Paris, the greatest distance runner of his day, is of medium height and build, with average arms and legs. He resembles most of the men you pass on the street or that pass your house every day and evening.

Some were disappointed in Nurmi's appearance. They had pictured a superman in build as well as in athletic feats, for it has long been the mistaken belief that the stars in various sports are men of giant physique. This impression has prevailed so long we take it for granted that only the boys of big bone and much muscle have a chance to become great athletes. However, if you will look over the list of stars you will discover that many of the great athletes were little men.

Surely no one believes that a little fellow has a chance in football. The game, it seems, demands men that are big and strong. It calls for weight, strength, and speed, but there is Frank Hinkey of Yale. If you have not heard of Frank Hinkey you will hear of him sooner or later, if you are interested in football, for Hinkey was the greatest end that ever played the game. Some critics insist that Frank Hinkey was the greatest football player of all time, all positions considered.

Hinkey never weighed more than 145 pounds when he played football. He was called the "Shadowy End" because he was the smallest man, and the thinnest, playing football in his day. What makes his work on the gridiron all the more remarkable is the fact that Hinkey played in the days of close formation and mass attack. Weight and brute strength were the two important factors in the game at that time. Few football players weighed less than 200 pounds and it was always a wonder how Hinkey ever made the varsity eleven. He not alone made it but he played football of a better quality than any other man. Small as he was none of the giants that Yale opposed ever got around Hinkey's end. He hurled them all back, tackling men that weighed nearly twice as much as he.

William T. Tilden II is undoubtedly the greatest tennis player ever developed. Tilden is more than six feet in height but he is thin. If you saw Tilden you would never take him for an athlete.

Gerald Patterson, of Australia, is one of the best players in tennis. While not so good as Tilden he is one of the finest in the world. Patterson is a giant of a man. To see him you would guess he must be a powerful athlete.

Tilden and Patterson played a match of three sets a few years ago. Tilden won the match and when it was over both players walked into the clubhouse locker rooms. Patterson slumped down into a chair, completely exhausted. Tilden, whistling and still fresh, was putting away his racquet. Patterson had spent his last ounce of reserve energy while Tilden still had plenty of reserve left.

Tilden has frequently gone through gruelling matches and left his opponent strength spent. Few persons understand how he manages it. Nearly always the opponent is heavier and stronger than Tilden. The reason is simple enough. Tilden does not waste an ounce of energy. He never exerts himself when he does not have to. He is careful with every step he takes and makes every one of them count. Years ago he realized that he did not have the strength most of his opponents had and that if he wanted to remain on top he would have to be careful of his energy. He could not afford to waste any strength. He must conserve all he had and use his head to make every stroke count.

Eddie Collins is not impressive physically. He is small, light and awkward. Yet he is regarded by many as the greatest second baseman of all time, a wonderful hitter and fielder and the most intelligent man that has ever played the position.

Tilden hits a tennis ball harder than any man who ever played the game. One time I asked him how he managed to get so much force behind the ball. His answer was simple enough:

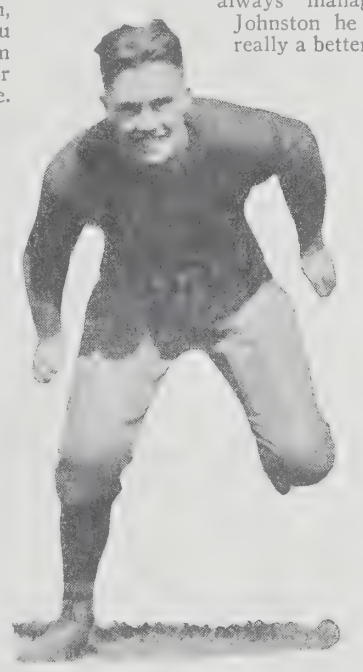
"It is all in timing. I throw my entire weight behind the racquet at the exact instant it meets the ball."

That is why Tilden can hit a tennis ball twice as hard as most men who are twice as strong as he. The trouble with them is that they use their strength through the entire swing of the racquet. Most of it is expended before the racquet meets the ball and while they use a mighty swing it is that much wasted energy, for when the racquet connects with the ball there is little behind it. Tilden reserves his strength until the instant that racquet and ball meet; then he turns loose his stored energy.

Tilden does not use his terrific drive all through a game. His "cannon ball" service comes infrequently and his terrific shots are sprung at the psychological moment, when his opponent is off guard, or when the situation is such that Tilden can score by use of the shot. The man who tries to smash every ball throughout a match slows up, first gradually and then rapidly. At the end of the match, when he needs a smashing drive to gain or hold an advantage, he is unable to get force behind the ball because he has wasted his strength.

"Little Bill" Johnston, the freckle-faced phenomenon from the Pacific Coast, is the second best tennis player in the world. Only Tilden is superior. He was king of the tennis kingdom until Tilden developed. While Tilden always manages to defeat Johnston he insists that Johnston is really a better player, a statement with which few will agree.

"Little Bill" Johnston is one of the smallest men that ever played tournament tennis but the United States has produced only one tennis player his superior.



Irwin Uteritz played varsity football for three years and never fumbled a punt or missed a tackle. He always got his man and the man always outweighed Uteritz, sometimes by 75 pounds.

Johnston is one of the marvels of tennis and of all sports as well. He is the lightest man among the ranking players of two hemispheres, weighing not more than 125 pounds through the tennis season, sometimes weighing less. Most high school boys weigh more than Johnston. But little Johnston has vanquished all the giants of tennis and generally beats them so badly that defeat becomes a rout. He lacks stamina and strength but he has a remarkable intellect and, like Tilden, he uses this intellect to win. He thinks more quickly than his opponent thinks.

A few years ago Irwin Uteritz, of the University of Michigan, was the best quarterback in the Middle West. It is doubtful if he had an equal anywhere, all things considered. Uteritz, in three years of play at Michigan, never fumbled a punt and never missed a tackle. Few backs could compare with Uteritz on defense. He always got his man. He tackled clean, hard and sure, always throwing the runner toward the runner's goal, a trick that not many men playing football ever really master. He was a splendid field general, the best in the football history of a university famous for great teams and players. But in the three years that Uteritz played football he never weighed more than 140 pounds. His weight was generally 135. I have seen Uteritz repeatedly throw men weighing from 50 to 75 pounds more than he weighed as though they were little boys. The reason Uteritz could do this was because he timed himself perfectly. He also had accurate direction. He had the genius of pace. He tackled the same way that Tilden makes his "cannon ball" shot in tennis.

The man who wrote "by might they triumphed" was not referring to sports. If he was he was not well acquainted with sports. In sport they triumph by mind rather than might. It is not the use of weight and power in sport that wins but the use of the mind.

William Keeler was one of the smallest men that ever played baseball. They nicknamed him "Wee Willie" when he began playing ball and he carried his nickname through life. He was so small that few managers would give him a second look and yet he was one of the greatest outfielders the game has known. He realized he could not hit a ball far so he made up his mind to hit the ball through or just over the infield. It was Keeler who, when requested by a newspaper to write an article on how to become successful as a batter, wrote this memorable reply:

"Hit them where they ain't.
"Willie Keeler."

No ball player ever hit as many singles as Keeler. None of the good hitters of the game ever made so few doubles, triples, and home runs. Still, Keeler got more than 200 hits in eight different seasons of his career and among all the ball players in history only Ty Cobb was able to equal or better that performance. Keeler was also the greatest hit and run man in all baseball. He worked this play oftener and was more successful with it than any rival.

Keeler, knowing that he lacked power at bat, depended upon his intelligence. He made a study of all pitchers, got an intimate knowledge of their style and so trained himself that he was able to meet the ball by using a short chop. He went through several seasons without ever striking out and he struck out less times than any player on record. All he tried to do was hit the ball to some unoccupied spot, to hit it safely, and this he managed to do often. He did not do it by strength, for he lacked strength. He did it by constantly studying pitchers and pitching and by his timing. He was the greatest of all scientific batsmen.

Eddie Collins never had more than one equal or superior as a second baseman. Opinion is fairly divided as to whether Napoleon Lajoie or Collins was the best second sacker of all time. Lajoie was a magnificent specimen of manhood, a man of remarkable physique, supple, easy, smooth, the personification of physical grace. Collins is small. He lacks ease and grace. He is awkward and for several years no one thought him big or heavy enough to make good in the major leagues. His was not the build that one looks for in second basemen where the fielder has to take his bumps from base runners. He developed into the king of second basemen. He also rapidly developed into a great hitter.

Collins is a fine fielder and a fine hitter for the same reason—intelligence. As a fielder he studied batsmen and base runners. He found out where to play for them. He discovered their characteristics and took advantage of them. As a batsman he studied pitchers. He was content to hit the ball. He was never a long hitter but a sure hitter and dangerous with men on bases when the pitcher makes an extra effort to fool the batter.

The National Open Golf Tournament of 1924 was opening at Oakland Hills, near Birmingham, Michigan. Driving out to the links on the morning of the tournament was little Cyril Walker. To the other passengers of the automobile he observed:

"Gee, it would be glorious to win this tournament. Just think of what it means to the winner! Fame and fortune! The golfer who finishes in first place is made. But it is not for a little fellow like me to win. This Oakland Hills course is built for long drivers. The men with weight and strength, who can wallop the ball for long distances, are the men that will be up in front."

Cyril Walker, weighing about 120 pounds, seemed to be making an accurate prophecy. The open championship of 1924 was being played over a course that gave an advantage to the golfer who could drive the ball a long way. On that Monday morning, as the tournament opened, little Cyril Walker was quite forgotten as a long list of famous golfers walked to the tee and drove off. The tournament ended Friday afternoon and in the fading light one of the contestants was lifted high on the shoulders of several of the conquered and given a mighty cheer by the others. The golfer who sat high on the shoulders of his fellows and waved his cap in response to the ovation was little Cyril Walker, open golf champion of 1924, lightest of all that field that included the mighty swingers of the game.

William Keeler was so small that they nicknamed him "Wee Willie." He could not hit a ball far but he became the greatest scientific batsman baseball has known.

Strength has its place in golf but the mental attitude counts for more. Cyril Walker, knowing his limitations as a driver, devoted himself to putting and the championship was decided on the greens instead of on the fairways.

De Hart Hubbard, holder of the intercollegiate and Olympic broad jump championships, is the smallest and the lightest man that ever held the broad jump title. All the other great broad jumpers were big and strong men if not actually giants, but most of them were giants.

The men mentioned here were picked at random. There are many others to compare with them, men that are not big but of average build and many of them below average. The highest honors in sport are for those of keen intellect rather than those of deep chest and bulging muscle. In sport the mind comes first, the body second.

Esperanto?—No, English Is Tongue

Long Sought International Language Was Growing Quietly All the Time

By DUNCAN M'CONNELL

THE World Language idea, long a subject of eccentric agitation by zealous propagandists, seems to have been clothed of late with unwonted dignity and consequence, by action of associations of international scope.

In a recent article in the *National Geographic Magazine* on "The Battleground of Languages in Western Europe," A. L. Guerard says:

"An international language is needed to make communications easy among those teeming millions who, whether they like it or not, are all members of the great economic society of nations. It will respect the independence and the pride of all existing dialects; it will not abolish, but transcend, frontiers. It will be the symbol of the new industrial and democratic civilization, which cannot be forever bound by the capricious historical lines of another age."

Undoubtedly the need thus expressed is a real need.

A Language Spoken by Many Nations

Undoubtedly the imposing organizations which are seeking a remedy are dealing with a condition which demands remedy.

Yet, while governmental and scientific bodies seem indeed to be looking directly at the question, they seem also to be looking away from the solution. They all seem to expect that some world-genius will devise or invent an Inter-Speech, and that this will immediately be learned by all as a new tune is whistled, adopted by all like the telegraph or the airplane.

The International Language of the future, already to an extraordinary extent the International Language of the present . . . a language not of theory, but of practice, is here in the English speech.

It requires no agitation, no argument, no propaganda—it requires only that the great fact, one of the greatest events in the whole history of languages, be calmly recognized by men and nations.

To aid calm recognition of this fact, and not with any intention of advancing a mere theory or extolling a mere linguistic hypothesis, we may consider first of all the efforts for an artificial international speech, since the artificial speech seems to be first in the deliberations of most theoretical students. Then we may mention different actual languages which have been recommended because of their expressional merit as worthy of coronation and homage by races of less perfect idiom. Then we may review the factual history of the languages of mankind, and the record of the rise of English.

For we can now unhesitatingly say that English has a wider spread among peoples of different speech than any Volapük or Esperanto. Indeed it has a wider spread than the Latin of the Middle Ages, or the Greek of Alexander's Empire, or the French of old periwig diplomacy.

As a racial language, as the speech of many individual nations, English has long held its vast plurality of use among the languages of the world. But in addition, as an international speech, it does and will fulfill all the requirements prescribed by Mr. Guerard, as quoted above.

The effort to produce a language to meet these requirements has been made by scholar after scholar since the philosophers of the early seventeenth century ceased the exclusive employment of Latin, and issued more and more of their works in their native living tongues.

Though Latin was passing from scientific use because of its fixed and "dead" character, some profound men imagined that a new philosophical speech could be created out of other dead materials. The name of the great philosopher Leibnitz is found among those who endeavored to develop a univeral written or picture language of symbolic or artificial characters, under the formidable name of Pasigraphil.

By the time the next century had arrived, Latin had passed not only out of use as an international language of science, but out of fashion as the language of diplomacy. The French "Encyclopedist" group, in their general reaching after universality of view, considered the need of an encyclopedic international speech. The principles then laid down by Faignet are regarded as including the fundamental theory of all later efforts for an artificial world-speech. Projects

Tried Volapuk and Then Esperanto

for a new language were included among the myriad plans for world rejuvenation bandied about in the French Revolution.

The nineteenth century was the season in which many universal languages developed from humble origins to pretentious maturity, then dropped and declined and decayed. One man invented a new musical speech, and taught others to sing it! During these years the grand new science of modern philology was developing, though associated with many theories of language which have since been outgrown. In the spirit of the time Schipfer in 1839 presented his "Communicationssprache" or "Inter-communication Language." This appears to have been the first definite and complete creation of a new speech.

Schipfer, however, was only one of many such creators of idiom. These have been counted until the count is lost. Some world-tongues were simple and apparently frail. Some were comprehensive, but more difficult than any language living or dead. One, called the Blue Language, required nine volumes of grammar.

There was usually a tendency on the part of the inventor to base his creation on his native speech, or on one of the dead classical languages. This produced in each new creation a special unfitness for the very purpose of international speech.

A different course was followed, and a livelier discussion created by the German prelate, Mgr. John Martin Schleyer, who in 1879 presented "Volapük"; and the Russian physician Zamenhoff, who in 1885 introduced Esperanto, with some indebtedness to the "Neo-Latin" of Courtonne of Paris.

Monsignor Schleyer took one step which shows that he had some true vision of the tendencies of language, even at that time. Though himself a German, he was acquainted with perhaps fifty languages, and refused to be local or insular in his linguistic thought. He affronted the national pride of German philologists and roused the patriotism of French linguists by basing his proposed world-speech upon English. He showed, indeed, his fundamentally Germanic training by elaborating a precise and rather abstruse grammar, but as a medium of expression of thought his Volapük rested upon English.

But Volapük, as a manufactured tongue, was subject to alteration by means similar to those which brought about its creation. While it was rising, rivals rose—the production of these linguistic nationalists whom we have mentioned. One new language came forward on a basis of Latin. From the other side of the Rhine developed Novicow, which was based on French as Volapük was based on English. This was not all. The adherents of Volapük, rejecting the Latin and French fabrications, still reserved the right to improve Volapük itself. There was a call for a simpler grammar, and new languages began to develop from the original. Dr. Schleyer had not only taught his pupils a "made" language, but he had taught them how to make others. In a few years the discord among the adherents of Volapük was as great as the Babel of pre-Volapük days. The language broke up in many languages, and universal communication was lost in misunderstandings expressed in ways mutually confusing, according to the use of improved or unimproved Volapük.

Dr. Schleyer had drawn national and international attention by reaching out to English for the basis of his new language. And the Russian Zamenhoff, when he signed the name "Dr. Esperanto" (hopeful) to his first communication, reached far outside of the Slavic linguistic family for his new speech.

He sought for his vocabulary words which were found in as large a number of languages as possible. The language was promoted in an international spirit, so that scholars of the first rank in London, Paris, Berlin, and Vienna gave it their support as an "auxiliary" tongue.

Esperanto reached an interesting development before the war. The interest in Esperanto itself was not

The Speech of Southern African Tribes

diminished, but men could see the temporal weakness of any artificial language. It has no guaranty of permanence.

Capable of quick hothouse growth are some of these artificial languages: but as soon as they are taken from the hothouse to face the outer air of reality, or as soon as a new bloom is developed in another part of the conservatory, their period is ended.

The war gave all language students some new insight into the psychology of speech, and the psychology of artificial languages. No war speech was made in Esperanto, because it was a peace language. But no peace speech which attracted any universal attention was made in Esperanto. Woodrow Wilson talked of peace in English. The great and grave transactions of those years were the transactions of nations, not of societies, and the tongues were mother tongues. Two incommunicable persons might learn swiftly to communicate on small matters in Esperanto or the Idiom Neutral—but when the peoples stood face to face with fate they spoke the languages which it had been their fate to learn. And thus the homes and schools of the Allied Nations made peace with the schools and homes of the Central Powers.

We shall mention now the suggestions of far-traveled scholars that some far-away living language be selected for neutral communication, that we choose some language merely because of its excellence as a medium of expression. There are some who have maintained that the most complete languages in the world are those belonging to the Basuto family, the tribes of Southern Africa. These languages have a very high degree of word-change or inflection, so that the most intricate shades and divisions of thought find a ready and unmistakable expression. But even if all is conceded for the Aamazulu tongues, we need never expect to see the western nations deserting their literature and their traditions for the glib speech of unlettered barbarians.

Among the languages of Europe much admired by outsiders, the modern Polish must be remembered. Some have declared that this noble Slavic tongue, built upon interesting harmonies of consonantal sounds, is the most perfect medium of human expression. Yet all will admit that to the person of Latinic or Teutonic speech Polish is difficult to pronounce and difficult to acquire. It will be and it should be learned by more Western Europeans and Americans, for the glory of its literature makes this an accomplishment which will bring much joy. But its greatest admirers do not expect Polish to become the world's international speech, though they may well insist that it is worthy.

The proposals for artificial international languages, and the proposals that some language be elected to an international post, have been based upon theories of speech, and not upon the facts in the history of races and tongues.

It is not the simplicity of a language which spreads it afar, else long ago, in the Persian Wars, the simple Persian would have been adopted in Athens instead of the difficult classical Greek.

It is not the powers of expression of a language which spread its power, or in that same era the wonderful expressiveness of Greek would have secured its adoption in Persia.

A language is the medium of expression of a nation or a group of nations. The prestige of a language partakes of the prestige of the peoples using it. Even so, the development of a certain dialect to a supreme place within a nation is always the result of the eminence attained by the people using this dialect.

The Greeks of pagan times listened to their political orators, read their classic poets and historians, ignored the Alexandrian and Palestinian folk who used the simpler Hellenistic Greek. But when the early church arose, with the New Testament in its hands, written in Hellenistic Greek, the pagan language passed away with the pagan gods. The Greek of today is based on the once-ignored Hellenistic dialect which is the original of the Christian Scriptures.

The Greek language was the first living speech to "transcend frontiers," when the military genius of Alexander carried his Macedonians through many empires, and his interpreters rendered into Greek for him the thoughts of many subdued nations. The Greeks, while proud of their speech, were not wholly unconscious of the significance of alien sounds, for even Homer has Sanskrit words for articles of commerce. However, it was Alexander's dream to carry Hellenic culture into all

When Rome Was Empress of the World

the world, for he wished to be a worthy pupil of his pedagog Aristotle as well as the dominant master of all kings.

Had the young giant lived for forty more years, to complete threescore and ten, we might have had an international speech in the third century before Christ. But of that godlike dream we have only a few names upon stones in the Persian desert, and a few Alexandrians scattered among the world's cities from Libya to India.

When Rome rose over Italy the urban tongue of Rome prevailed above Oscan and Umbrian and the rustic dialects. The pre-eminence of the Roman language might have declined to nothing like the prestige of the Roman arms; but with the decline of the dignity of the imperial city the language remained as the voice of a presiding church.

There was no scholarly society which made Latin understood in Britain and in Syria during the days of Roman imperial power—it was not by resolutions of any international-language club that Latin continued to be understood in Spain and in Poland through the Middle Ages. The prestige of the empire, the prestige of the church, were first—then followed the prestige of the language which these powers employed.

For centuries all things united to hold Latin pre-eminent. The old Empire had been the symbol of all power, while the Church was the symbol of all wisdom. Therefore wisdom and power had their utterance in Latin: the decrees of rulers, the laws of states and cities, the edicts of courts, the charters and deeds of land, and the writings of all men who would be deemed wise. Latin was pre-eminent in the world at large. But the nations still saw other tongues developing in power as Rome's dialect had developed in Italy. The success of King Alfred made the Middle Saxon of Winchester paramount in England; the accession of Hugh Capet of Paris made the French of Paris supreme in France.

In every country of Europe the dialects struggled like feudal princes, for dominance. But the triumphant dialect became interprovincial, interurban, just as Latin remained international. Prestige might be conceded, for a longer or shorter time, to one form of speech, just as prestige was yielded to Swabian German in the time of Frederick Barbarossa, and prestige has since been allowed to Saxon German since the publication of Luther's Bible. But the pre-eminence of a form, or a language, was held only as long as the pre-eminence of those who used it.

Thus it came about that when the division of the Christian churches arose, the Latin language might continue in full power among all who adhered to the Latin body, but some new international speech might arise for wider communication. Now were witnessed, as we have seen, efforts by Leibnitz and others to fabricate a language for philosophy and science. The efforts all failed, and ended in all philosophers and scientists writing in their various mother tongues.

While philosophy might proceed without an international speech, statecraft demanded one. And now there was arising in Europe a power which proclaimed the spiritual faith of Rome, but did not always bind itself in political alliances with other nations of the same church. It was the wondrous fortune of France to have

French as the Language of Diplomacy

in Louis XIII a stammering and futile monarch, while it possessed in Richelieu a supremely cogent and powerful prime minister.

In the King Richelieu gathered up the greatness of France, in France he gathered up the greatness of Europe. For all the years of his regime and for the first great years of Louis XIV Europe moved or stood still, made peace or war, according to what was done or planned or threatened by Paris. Without doubt the French masters meant to dominate Europe, and without doubt all Europe admired while it feared. So treaty makers and statesmen, kings and ambassadors, set down their plots and counterplots, their alliances and federations, in the language of Richelieu and Louis XIV—"the French of diplomacy."

In every court the power of France was felt, and in every capital the language of France was spoken. Kings of Prussia who spoke German imperfectly, like

The Pursuit and Capture of Booth

Flight of Lincoln's Assassins Ends at Garrett Home—Fourth Article

By F. L. BLACK

SAFETY at last! What more welcome sight to John Wilkes Booth, the mad avenger of fancied wrongs, than three Confederate soldiers!

They were officers of the Lost Cause returning home from the surrender. At Winchester, Virginia, on April 21, 1865, Colonel John S. Mosby, among the bravest of Confederate officers, had surrendered his command and disbanded his forces. Three of his staff, Captain Willie S. Jett, Major M. B. Ruggles, and Lieutenant A. R. Bainbridge, were making their way homeward three days later, when they arrived at the Port Conway ferry and came face to face with Booth and Herold.

Captain Jett in his testimony at the conspiracy trial said he was on his way to Caroline County, Virginia, in company with Ruggles and Bainbridge when at Port Conway he saw a wagon on the ferry wharf. A young man got out of it and asked to what command they belonged. Ruggles said, "We belong to Mosby's command." The young man then said, "If I am not inquisitive, may I ask where you are going?" Captain Jett replied, "That's a secret."

A man with crutches then got out of the wagon and one of the soldiers asked him to what command he belonged. He replied, "To A. P. Hill's corps." Herold said their name was Boyd; that his "brother" had been wounded below Petersburg, and asked if they would take him out of the lines.

The party then rode up to a house there, and having tied their horses, they all sat down. After they had talked a very short time, Herold touched Captain Jett on the shoulder and said he wanted to speak to him. He went with the captain down to the wharf, and said, "I suppose you are raising a command to go South?" adding that he also would like to go. The captain replied, "I cannot go with any man that I don't know anything about." Herold seemed much agitated, and then said, "We are the assassinators of the President." Captain Jett was so much confounded that he did not make any reply. Ruggles was near, and was told the news. Booth then came up, and Herold introduced himself and Booth. It was testified by Captain Jett that Booth had "J. W. B." tattooed on his hand.

Recent views of the Garrett house. The place on the porch indicated by the arrow is where Booth died.

When the party crossed the river, Booth rode Ruggles' horse. Herold was walking. Captain Jett rode to Port Royal and asked a woman there if she could take in a wounded Confederate soldier for two or three days. She at first consented; then afterward she said she could not. Booth was finally left at the house of Richard H. Garrett. Bainbridge and Herold went to a Mrs. Clark's, and Ruggles and Jett to Bowling Green. The next day Herold came to Bowling Green, spent the day, had dinner, and left in the evening, and that was the last Captain Jett saw of him, except the night that Booth and Herold were captured when he recognized Herold as the man he had seen with Booth.

Herold said he wanted the officers to help get Booth farther south, but they refused.

According to Major Ruggles' narrative in *The Century*, January, 1890, "The ferry (between Ports Conway and Royal) was owned by a man named Rollins, but the scow was run—that is, poled across—by a Negro. The scow was on the other side of the river when we rode up."

In a signed statement addressed, "To the Editor of the New York *Herald*," in 1865, Richard Garrett said: "This man, whom I and all my family looked upon as Mr. Boyd, a wounded Confederate soldier, was taken at once into my house. He supped with my family, and slept that night in one of my upper rooms, in which my sons, John M. and William H., and two smaller children slept. He breakfasted with my family the next morning and remained in the house and yard, most of the time reclining upon the grass in the yard, my little children often being with him. He had very little to say and seemed to be suffering, we thought, from his wound.

"After breakfast that morning my eldest son, John M., rode to a shoemaker's, about one mile from my house, to have his boots repaired, and while there he met a gentleman of the neighborhood who had obtained by private means a newspaper from Richmond (there being no mails to our section), and this paper had in it an advertisement offering a large reward ($150,000, I think) for the capture of Booth, the murderer of President Lincoln. After my son's return, and while at the dinner table, he spoke of having seen this paper containing the advertisement. This man, who was at the table, remarked that he would not have been surprised if half a million dollars had been offered, but that he had heard that the man who committed the act had been arrested between Baltimore and Philadelphia, and was now in Washington. He having before this told me that he was a native of Maryland, I then asked him if he had ever seen the man Booth who was charged with the offense. He said he had seen him once. He saw him in Richmond about the time of the John Brown raid. I asked him if he was an old or young man; he said he was rather a young man.

"I had never heard of but one Booth as an actor, and thought it was Edwin Booth. My younger son, who was a mere youth, remarked, 'I wish he could come this way, so that I might catch him and get this reward.' He turned to him and said, 'If he were to come out, would you inform against him?' My son, laughing, said he would like to have the money. The man took all this coolly, and showed nothing like excitement upon the occasion, and caused no grounds of suspicion in any of our minds that he was the man who had done the act. Some two or three hours after dinner, two men on horseback, with a third man riding behind one of them, rode up to my gate on the main road. The man who was riding behind got down and came to my house, while the other two men rode on toward Port Royal. When this man came to the house the man who was here introduced him to my son, John M., who was in the yard, as Mr. Boyd, his cousin. They walked up the road from my yard, and seemed to be in earnest conversation.

"Very soon after this the two men who had passed on horseback returned, riding very rapidly—one of whom was Lieutenant Ruggles—and said to the men who were here, 'The Yankees are crossing at Port Royal, and you must take care of yourselves the best way you can,' and rode off immediately. I was a short distance from my house, where my laborers were at work, and on coming to the house I saw these two men going off toward the woods. Soon after getting to the house, one of the men, who proved to be Herold, returned to my yard. My son and I said to him we should not be surprised if those forces were in pursuit of him and his friends. He said: 'Oh, no, we have done nothing to make them pursue us'; but that he had heard that some Federal soldiers who were stopping the night before at a place called the Trap, between here and Bowling Green, had had their horses stolen, and he expected these forces were sent down from Fredericksburg to endeavor to capture the thieves. Soon after this the Federal forces passed the road by my house, and went on toward the place at which the horses were said to have been stolen.

"After the forces passed, Herold went to the woods and brought his friend back to the house. They took supper with my family, and, after supper, I, feeling ill, went directly to my room, and my sons and these two men went to my front porch. My son said they seemed to be very uneasy, and that they said they were anxious to get a conveyance to Orange Courthouse, at which place they heard there were a good many Marylanders who were endeavoring to get west of the Mississippi River, and that they wished to go with them. They asked my son if he knew of any conveyance they could get that evening to go part of the way. He told them there was a colored man living nearby who had a horse and carryall that he hired out at times. They endeavored to get it, but the man was away from home. They then offered my son $10 to carry them about twenty miles on the way. He told them that he could not go that night, but that if they wished to go next morning he could take them. They proposed sleeping in my house that night, but my son objected, as he thought from their excited manner there was something wrong about them. They then proposed sleeping under my front porch; but he told them we had bad dogs, and they might be annoyed by them. They then asked if we had not an outhouse in which they could sleep. He told them there was fodder and hay in the tobacco house, and they could go in there if they liked.

"They went in there, and after they did so my two sons, having heard Herold say, 'We should like to get the horses we saw you riding this evening,' and fearing they might get up in the night and take their horses and go off, my sons concluded to take their blankets and go into a cornhouse, between the tobacco house and stable, and guard their horses; and my youngest son fearing, as these men were heavily armed, that if they attempted to take the horses they might have great difficulty, and might probably get shot, concluded he would take the key to the house and lock the door outside, so as to prevent them coming out if they wished to. This is the reason why the door was found locked when the officers went to the house. About two o'clock a. m., I was awakened by the violent barking of my dogs. I arose from my bed and went to the window, and I found the house surrounded by armed forces. I drew on my pantaloons, and, without waiting to put on any other dressing, I opened the door to my end porch, and when I did so three men rushed in and one of them put a pistol to my head and said to me, 'Are there not two men in your house?' I said no; that there were two men here last evening; that they went to the woods when you were passing, and afterward returned and got their supper, and I did not know at that time where they were. I had gone from my supper to my sleeping room, and did not know where they had slept.

"The officer said I was not telling them the truth, and called for a rope and said they would hang me. Being thus rudely treated, I no doubt appeared scared and affrighted. About this time my son, John M., came to the door and said to the officers that these men were in the tobacco house. They put me under guard and carried my son with them to the tobacco house, and made him go in and try to bring the men out. When he went in he addressed Booth as 'Mr. Boyd,' as the officers said, and told him there was a large force surrounding the house, and he had better surrender. He ordered my son out, and appeared to be drawing a pistol, and he ran out. The officer then parleyed with the men inside for some time, when Herold expressed a wish to surrender, and Booth said to the officer that the man in here wishes to come out. The officer told him to hand his arms to one of them, I believe to my son at the door, and to come out. Booth said the man had no arms; they were all his, and they would not be delivered up. Herold then came out, and Booth refusing to surrender, Colonel Conger ordered the house fired to force him out. When he gave these orders Booth said to him, 'Don't destroy the gentleman's property; he is entirely innocent, and does not know who I am.' The house was then fired, after which Sergeant Corbet shot Booth, and he was brought out and died on my porch.

Boston Corbett, the sergeant who shot Booth. A photograph by Brady taken soon afterward.

"It was not until after Booth was shot that we were told who he was; we had no idea that they were the murderers of the President. When the forces passed my house they went to Bowling Green and got Jett, the man who brought Booth to my house, and he told them that he left Booth at my house. When he came here I asked him why he brought that man to my house and left him here as a wounded Confederate soldier, and had brought so much trouble upon me. He said he wished to get clear of him, and left him at the first house he came to after leaving Port Royal; that he had told the officers when they came to Bowling Green, that he had left him with me as a Confederate soldier, and that I was not apprised who he was. I told him to make that declaration to an officer in my presence. He made it to Lieutenant Dougherty, who was the officer in command of the regular forces, Colonel Conger being a detective, but in command, I understand, of the expedition.

The Story of Eliot's Bible

The First Bible Printed in America

By LOUIS C. KARPINSKI

IN THE early days of New England the spread of the Gospel among the Indians was a major concern of a large group of Englishmen who formed the "Society for the Propagation of the Gospel among the Indians." This corporation had as two fine representatives the Rev. John Eliot and the Rev. Abraham Pierson.

The Rev. John Eliot arrived in New England in 1631 and became the first preacher at Roxbury. This "Apostle to the Indians" was distinguished by a fervent piety, a real love of learning, and a burning enthusiasm for evangelization. Eliot assisted in the preparation of the metrical version of the Psalms which appeared in the Bay Psalm Book of 1640, the first book from the press in America north of Mexico.

Eliot's study of the Massachusetts Indian language enabled him to preach to the Indians in 1646. In 1649 Eliot wrote to Winslow: "I do very much desire to translate some parts of the Scriptures into their language, and to print some Primer wherein to initiate and teach them to read."

The Primer printed in Cambridge in 1653 has entirely disappeared and so also has disappeared entirely the second edition of 1662, of which 1,500 copies were printed. Genesis and Matthew were separately printed in 1655 but both have vanished as though never issued. Eliot completed his translation of the Bible in 1658 and the progress through the press will be traced below.

Nuppoquohwusseuenanan.
CAMBRIDGE:
Printed by Samuel Green and Marmaduke Johnson.
MDCLXI.

Extremely rare New Testament in the Massachusetts Indian language, 1661.

Abraham Pierson wrote a Catechism for the Connecticut Indians, called "Some Helps for the Indians . . . . To Know the True God . . . . ," printed by Green in 1658-1659. Only a single copy has survived. The Indians were evidently not careful preservers of books, or possibly perused them too devotedly.

Both Pierson and Eliot received financial support from the society in England. An Indian college was located in Cambridge "in a house built strong and substantial of brick, at the expense of the Corporation in England, . . . cost between £300 and £400." On account of the dearth and death of Indian "scholars" this building "was taken to accommodate English scholars and for placing and using the Printing Press belonging to the College."

This press used for the printing of the Bible in the Indian (Algonquin) language was quite certainly that first press brought to the colonies north of Mexico, by the Rev. Mr. Glover and the press upon which Stephen Daye printed in 1639 "The Freeman's Oath" and an "Almanack," and, in 1640, the Bay Psalm Book.

The printer who began to print in the Indian language was Samuel Green who arrived in New England in 1630 with Governor Winthrop. As early as 1652 the project of printing the New Testament in the Indian language was discussed with the Corporation in England. In 1654 a special grant of £20 further for type and paper was granted to Green and this material arrived in 1655. Again in 1658 a further appropriation of £20 was made. In this year appeared Pierson's translation of the Catechism for the use of the Indians in the New Haven District. In 1659 a version of the Psalms appeared also from the press of Green.

In 1659 one hundred and four reams of paper were received toward printing the New Testament from the Corporation in England and further hundreds of reams were provided by them later. To them Green sent a specimen sheet which was acknowledged in a letter dated from London, April 28, 1660. This reads: "Conserning youer Printing the New Testament in the Indian Language, a sheet whereof you haue transmitted to vs, wee concurr with youerselues therein, and doe approue of that prouision you have made for printing the same conceiueing and offering as our judgments that it is better to print fifteen hundred than but a thousand; hopeing that by incurragement from Sion Collidge, with whom we haue later conference, you may bee enabled to print fifteen hundred of the Ould Testament likewise. . . .

"Wee haue out of our desire to further a worke of soe great consernment [printing the whole bible in the Indian language] agreed with an able printer for three yeares vpon the tearmes and conditions enclosed. Wee desire you at the earnest request of Mr. Johnson, the printer and for his incurragement in this undertaking of printing the bible in the Indian language, his name may bee mentioned with others as a printer and person that hath bine instrumentall therein; for whose diet, lodging and washing wee desire you to take care of."

The New Testament was completed quite early in 1661 and from Matthew to John was the work of Samuel Green. An Indian apprentice, who received the name James Printer, assisted Green, and late in 1660 Marmaduke Johnson arrived from England to act as printer. The names of Green and Johnson are thus associated with this first Bible of the New World.

Directions were given in September, 1661, by the commissioners of the New England Colonies acting for the English Gospel Society that two hundred of the New Testaments were to be bound "strongly, and as speedily as may bee with leather or as may bee most serviceable for the Indians; and deliuer them forth as you shall haue direction from any of the commissioners for the time being of which keep an exact account that soe it may bee seen how they are Improved and disposed of; alsoe, wee pray you take order for the printing of a thousand coppyes of Mr. Eliotts Catichismes which we vnderstand are much wanting amongst the Indians, which being finished, Receiue from the Presse and dispose of them according to order aboue-said."

The Old Testament was three years in the press, appearing finally in 1663. Some copies bear a dedication to Charles II.

The total cost of the Bible in 1,000 copies, with an extra 500 of the New Testament, an edition of the Psalter, two of Eliot s Catechism, and an edition of Baxter's Call to the Unconverted, together with some bindings, was estimated by Isaiah Thomas (in 1810) at £1,200 sterling.

Marmaduke Johnson, it must be recorded, acted unwisely in making love to Green's daughter, "alluring . . . . and drawing away her affection without the consent of her father," being "a direct breach of a law of the colony," so Isaiah Thomas states. What was more serious was that Johnson had a wife in England, and the errant printer was ordered "to go home to her." However, he remained and later becoming free married another girl.

A second edition of the Eliot Bible was printed in 1685 in Cambridge by Samuel Green. A second edition of the New Testament in 1680 was brought out by Eliot with the assistance of John Cotton of Plymouth.

The Bible as printed by Green and Johnson is a fine specimen of printing, an ornament and credit to the early American press. Some twenty-odd copies of the New Testament have been located and are accounted among the great rarities of any library of Americans. Thirty-nine copies of the Bible were located in 1891 by Dr. Wilberforce Eames in his "Bibliographic Notes on Eliot's Indian Bible," a fascinating account of the great work. At least four more are now known. One copy in the J. P. Morgan Collection belonged to the Rev. Thomas Shepard, a New England graduate of Harvard in 1653, and preacher in Charlestown from 1659 until his death in 1677. This copy bears the inscription, "ye gift of ye Revd. Translator." A fine copy today would bring two thousand dollars in the auction book market, and an association copy, like the one mentioned, would bring more.

The Massachusetts tribes for whom this book was printed are no more and only one or two scholars can read their language. The word "mugwump" was taken from the Bible by Secretary Trumbull, of the Connecticut Historical Society, and was adopted into the vernacular, one of the few traces of its influence. A few copies of the Bible, of John Eliot's famous Indian tracts, and of these catechisms remain as a monument to the Indians and to their inspired and devoted servant, John Eliot, one of the choicest souls of early American history.

Title-page of the first complete Bible published in America. This was in the Indian language by John Eliot. The next complete Bible was in German in 1743.

Easter Palms From Bordighera

By MRS. HALLIE HOGG

AMONG the beautiful towns of the Italian Riviera, Bordighera stands out with distinction, owing to the plantations of date palms which are cultivated extensively here. On the eastern side of the ridge, where they are sheltered from the westerly winds and exposed

A plantation of stately palms.

to the heat of the sun, they flourish luxuriantly and come to full perfection. They are not cultivated for their fruit, as in the oases of Tunis and Algeria, nor yet for their beauty, as in the other towns of the Riviera, but primarily for their leaves. They are a most profitable kind of property, as hundreds of thousands of these are exported to the Catholic countries of Europe and particularly Rome for Easter, and are also supplied for the Jewish Pascal ceremonies in September.

They are of all sizes, from patriarchs with a burden of 300 to 400 years, and 100 feet high, to mere nurslings of a few years. In September the beauty of their graceful fronds is marred for utility. The leaves are then prepared "alla Romana"; they are tightly rolled and bound round the trees, to bleach them, as the white palms of Easter are twice as valuable as the green leaves. Two or three weeks before Easter, they are unbound and cut down, ready for exportation. In July, the shorter and blunter leaves are prepared "all'Ebrea" in the same way for the Jewish ceremonies in September. The time involved is shorter as the shade required is a yellowish green.

As far back as 1584 the privilege of providing palms for the Vatican for Palm Sunday and Holy Trinity services was granted by Pope Sixtus V to Captain Brescia, a resident of San Remo. Since then the cultivation of the palm has been transferred to Bordighera, and although the inhabitants of Bordighera, generally, engage in the business of supplying palms to the rest of Europe, the descendants of Captain Brescia still hold the monopoly of supplying them to Rome.

This privilege was granted for important services rendered during the erection of the obelisk in Piazzo San Pietro, Rome. Contrary to the orders of the Pope for silence, at a critical moment when the ropes were slackening, the captain cried out, "Wet the ropes." This being done, the obelisk was safely raised to its present position. The Swiss Guards, obedient to their orders, brought the man before the Pope, but, instead of punishing him, the Pope promised to grant any request he might make. First asking for and receiving the Pope's blessing, he then asked for the right to supply palms to the Vatican for himself and his descendants, which request was also granted in perpetuity.

The Story of Hudson's Bay Company

How the Company Explored New Lands and Developed New Prospects

By D. M. LE BOURDAIS

The first installment of this article appeared in our last week's issue.

SPACE does not permit of even a recital of the many stirring and interesting events of which the company's history is filled during its first century. Prince Rupert remained governor until his death in 1682, whereupon the Duke of York, brother of King Charles, became the second governor. Upon his accession to the throne as James II, he in turn was succeeded as governor of the Hudson's Bay Company by Lord Churchill, afterward famous as the great Duke of Marlborough. The latter having been more or less active during the Revolution in driving his gubernatorial predecessor from the throne of England, the company did not suffer any curtailment of its privileges, as might have been expected in view of its Stuart antecedents, when William of Orange came to the throne, but rather was successful in having its charter confirmed by parliament.

Until 1763, when the Peace of Paris forever put an end to the aspirations of France in Canada, the Hudson's Bay Company was subject to attack by agents of both New and Old France by land and by sea. Thus the company's forts on the Bay—Prince of Wales, at the mouth of Churchill River; York, on Hayes River, three miles south of the mouth of Nelson River; Severn, on the river of the same name; Albany, also on the river of the same name; and Moose, on James' Bay at the mouth of Moose River—were in turn captured by the French, recaptured by the company's officers and the process repeated in some cases many times over.

Radisson and Groseilliers, after four years' service with the company following the granting of the charter, complained of the treatment accorded to them and returned to the allegiance of the French crown. During the next ten years it was Radisson's fortune to capture for his new masters a number of the forts which had formerly been erected by him for the Hudson's Bay Company. As he had some time previously married the daughter of Sir John Kirke, one of the incorporators of the company, he was eventually induced, however, to change his allegiance once more and again to enter the employ of the Hudson's Bay Company. After a number of further trips to the Bay he retired to live out the remainder of his life in London; apparently, from certain entries in the company's minutes, at times far from enjoying that degree of prosperity which might have been expected of one who took such a prominent part in the organization of the great Company of Adventurers of England Trading into Hudson's Bay.

There were times, however, during the wars with France when the company was none too affluent, times when money must be borrowed to send out ships which frequently fell into the hands of the enemy; there were times when French traders succeeded in intercepting the Indians on their way to the Bay and the cream of the fur trade was diverted to Montreal and Quebec. From 1686 until the Treaty of Utrecht concluded hostilities in 1713, the company suffered serious losses. The brothers LeMoyne, particularly Pierre, surnamed D'Iberville, by a series of overland expeditions from New France and also by sea, more than once virtually drove the company from the Bay. The treaty provided for the return of the forts, but claims made by the company for financial recompense were without avail.

The Rise of the North West Fur Company

The first four decades of the eighteenth century were years of peace and prosperity for the company's posts on Hudson Bay; but attack was soon to come from another quarter. Secretive as had been the company's policy with regard to its profits and operations, knowledge became diffused as to the valuable nature of the concessions which it held, and others became desirous of obtaining similar privileges for themselves. The principal point of attack against the company was that its charter had been granted in consideration of its undertaking, among other things, to prosecute a search for a passage to the south seas. Even at this time very little was known regarding the extent of the territory which King Charles had signed away; and the common impression among geographers was that the western ocean was not far distant from Hudson Bay and it was generally believed that a passage would eventually be found leading through to Far Cathay and the countries of the Orient. Consequently there was much outcry against the company for its failure to conduct these explorations.

The company's interests were menaced also from another quarter. French explorers from Montreal were advancing into the interior and erecting forts at strategic points. In 1732 De la Verendrye, an explorer of Three Rivers, had established a post on Lake of the Woods, and in the years following he and his sons had extended their explorations from the Missouri River to Lake Winnipeg and as far west as the foothills of the Rocky Mountains. During this time the Hudson's Bay Company had slumbered peacefully on the Bay in the expectation that the Indians would travel hundreds of miles to bring furs to its forts. But the effects of such competition were beginning to be felt.

These considerations led the company in 1769 to commission one of its employes, Samuel Hearne, to undertake an expedition of discovery into the interior and also to locate if possible the whereabouts of the "Far-Off-Metal-River," of which the Indians had spoken and from which they apparently obtained supplies of native copper. A narrative of Hearne's travels would fill volumes; suffice it to say that he discovered the great river now known as the Coppermine and traced it to the Arctic Ocean in the summer of 1771, being thus the first white man to reach the Arctic Ocean overland.

In the meantime, New France had passed into the hands of the British; and the power of the monopolists of France being removed, a new impetus was given to the fur trade of the towns on the St. Lawrence. The suppression of the Jacobite uprisings had resulted in the emigration to North America of numbers of adventurous Scottish Highlanders of good family. Many of these had settled in Canada and some of them had become well established in business in Montreal.

Monopoly rule does not lend itself to initiative; so when the official monopoly of New France ceased its control the great machinery of the French fur trade—forts, voyageurs, traders—was left without a head. But not for long. The shrewd Scottish traders were not slow to seize their opportunity. At first these new traders operated independently of one another; but they soon realized that the most effective means of meeting the competition of the century-old Hudson's Bay Company was by coöperation. Accordingly an organization known as the North West Company was formed, of which the moving spirits were Joseph and Benjamin Frobisher and Simon McTavish, of Montreal.

Trading headquarters were established at Grand Portage, west of Lake Superior, and other independent traders were invited to join the company. The Nor'-Westers, as they were called, rapidly extended their trade over the entire Northwest. They recognized the explorer as the natural precursor of the trader; and within a quarter of a century partners and agents of the North West Company explored more of the Northwest, including Rupert's Land, than had the Hudson's Bay Company in a century and a half.

Alexander Mackenzie, one of the Nor'-Westers, descended the great river which now bears his name and explored it to the Arctic Ocean in 1789. In 1793 he crossed the Rocky Mountains and, traversing what is now the province of British Columbia, reached the Pacific Ocean, the first white man to cross the continent by land.

David Thompson, an astronomer and surveyor, who had first been in the employ of the Hudson's Bay Company and found his opportunities too limited, was taken into the service of the Nor'-Westers and for them pursued his explorations to the mouth of the Columbia River, but found himself too late; for the Pacific Fur Company, owned by John Jacob Astor, of New York (represented, it is true, by ex-Nor'-Westers), had built Fort Astoria just two months previously. He built a fort farther up the river, however, and intercepted their trade. Simon Fraser, another Nor'-Wester, descended the Fraser River, the chief river of British Columbia, in 1808. Stewart, Quesnel and other members of this enterprising organization are commemorated in the nomenclature of the prairies and the Pacific slope.

The boundary line between the British possessions and the United States having been defined west of Lake Superior, it was discovered that Grand Portage was in American territory. The North West Company accordingly removed its headquarters to a new location at the mouth of the Kaministiquia River, which was called Fort William in honor of one of the chief partners of the company, William MacGillivray. Here the "lords of the lakes and forests," as they are called by Washington Irving, met annually to divide their profits and to hold high revel. Many tales are told of the bacchanalian orgies which were held by these boisterous spirits when they were gathered together after spending months in lonely trading posts or on arduous exploration trips.

When Simpson Became Governor-in-Chief

The Hudson's Bay Company now strained its every effort to meet the fierce competition of the vigorous Nor'-Westers. Clashes between the rival traders were common, and on more than one occasion blood was shed. Both companies plied the Indians with liquor, and even drugs, in the ferocious fight for trade. If the rivalry had been longer continued it doubtless would have destroyed not only the companies but the fur trade as well, to say nothing of the Indians, who had by now come to be dependent for their sustenance on the traffic in furs. The Hudson's Bay Company had always maintained a paternal attitude toward the Indians and had encouraged them to conserve the fur-bearing animals by buying skins only when killed at the proper seasons. But the methods of the Nor'-Westers would speedily have exterminated the fur-bearing animals.

There is not space to go into further details of this bitter feud, nor can any account be given of the ill-fated Red River settlement, around which the contest waged so fiercely, save perhaps to state that it was the sanguinary climax which developed out of the Nor'-Westers' opposition to the latter project, which for the first time forced the rival companies to realize that their only hope lay in fusion. In 1821 an arrangement was effected whereby the newer company was absorbed by the Hudson's Bay Company.

There is no doubt that the addition of the new blood was of great value to the old company, but it will be realized that it was no easy matter to reconcile the various members of these two hostile organizations so lately engaged in bitter strife and to induce them to work together toward a common objective. The man for the task was at hand, however, in the person of George Simpson, governor-in-chief of Rupert's Land since the previous year. He was a natural executive, vigorous and energetic, and undoubtedly the greatest officer the company had developed in its history of more than a century and a half. During his régime of almost 40 years the company reached its zenith. He found the company shaken and torn, fighting strenuously to retain a foothold in the great territory covered by its charter, while its rivals controlled the trade over an area much greater in extent and fast increasing. He left the company the undisputed lords of the fur trade from Labrador to Alaska and from Oregon to the Arctic Ocean; for in addition to the enormous area which the company held under its charter, it obtained from King George IV in 1821 a license for 21 years, which was subsequently renewed for a further similar period, granting it the exclusive right to trade with the Indians in the territories not included in the original charter, thereby extending its sway over all of what is now British Columbia and part of the states of Washington and Oregon. It was not the fault of the Hudson's Bay Company that much of the latter territory is not now part of the Dominion of Canada.

In 1867 the Dominion of Canada came into being as a result of the federation of the provinces of Canada and the British colonies on the Atlantic. It was the hope of its founders that it should one day extend from coast to coast; but no such consummation was possible so long as the rights granted to the Hudson's Bay Company by King Charles that day in May nearly two centuries before remained in effect. Negotiations were accordingly begun by representatives of the Canadian Government with a view to the transfer of the territorial rights of the company to the Canadian people. Eventually an agreement was reached in 1870 whereby the company surrendered its territory and rights of government in Rupert's Land for £300,000, and the right of the company to retain one-twentieth of the land within the Fertile Belt, as well as certain blocks of land surrounding its trading posts or forts. There were a number of other lesser considerations.

Thus as "true and absolute Lords and Proprietors" the Governor and Company of Adventurers of England Trading into Hudson's Bay passed from the stage, but as merchants and traders they probably do a greater business now than ever before; thriving cities have been built on the sites of many of their former trading posts; and the latter have in turn been supplanted by huge modern department stores filled with costly and varied merchandise from the four corners of the earth.

Esperanto?—No, English Is Tongue

(Concluded from page 10)

Frederick the Great, were masters of French and aspired to be French authors. Even in the days of George III, ruler of England and of the German Kingdom of Hannover, communications between members of the royal family were often written in French. French was a 'court language" throughout Europe because it was a diplomatic language, and it was a diplomatic language because of the magnitude of its masters.

There are some who have still contended that French should remain as the language of diplomacy. Without doubt it would have so remained, and its empire would have been vastly extended, if the history of the European colonies since the days of Louis XIV had been different. If France had retained New France and Louisiana, preserving the vast expanse of Canada and the princely domain of the American West; if she had held fast to India, if she had sustained her whole power in Europe, the world would be different in aspect, and different in speech. But the men of English tongue have succeeded to her domain in many regions, and also to the domains of many others. For the English have followed Spaniard and Hollander in South Africa, the American has trailed after the Spanish pioneers through the far Southwest; German Africa becomes a chain of British dependencies—even Turkey sees Cyprus and other colonies change the Crescent for the Crosses of St. Andrew and St. George.

And what linguistic result comes from these and from other international events? What could be expected?

And this, after all, is why English, even now, is a world speech. It is the speech of problems and of destiny. For years before the war many Germans and French, watching the Rhine from opposite sides, studied both languages. A few years before the World War, because of larger contacts in the world outside, contacts of understanding or of rivalry, the English climbed to pre-eminence among living languages in the schools of both Germany and France. Today there is no question of the leadership of English among modern tongues studied in French and German schools. This fact demonstrates wisdom among the parents, teachers and students.

The World Now Under Sway of English Language

It requires only a glance at the globe to realize how much of the world now lies under the sway of Anglican speech—it is not a question of Europe alone, but of every other continent and portion of the world. So in Italy, Spain, Switzerland, Holland, as well as Germany and France, in Africa as in Asia, the speaking of English is an accomplishment everywhere craved and admired by those not to the language born.

There are some, still clinging to old traditions of diplomacy, who do not realize the meaning of the fact that when the nations of the whole world gathered at Versailles, to make a treaty of greater significance than any previous bond of peoples, they discussed the question of the language of that instrument. And there, in the most conspicuous theater on which such a drama could be enacted, the English language assumed a role equal to that which France had so long played. The Treaty of Versailles, the Treaty with Poland, both bear the express declaration that the English and French texts shall alike be deemed authentic. And in sessions of the League of Nations today, English ranks with French as the language of the deliberations.

The Pursuit and Capture of Booth

(Concluded from page 11)

"These are the facts of the case; those in regard to the burning of the barn were learned of my sons, who were present. The subject of the murder of the President having been talked of at church the day before Booth came to my house, I condemned it publicly in unmeasured terms."—RICHARD H. GARRETT.

John W. Garrett, an ex-Confederate soldier and one of the sons of Richard Garrett, testified at the trial of John H. Surratt:

"I saw Booth ride up to our house on Wednesday with Jett and Ruggles—I do not remember the date. Herold came next day in the afternoon. Booth was very lame. He said that he had broken his leg. Booth slept in the house the first night and remained about the house next day. I saw him at dinner. After dinner some Cavalry came along and he and Herold left the house for a short while.

"They came back and after supper he and Herold went to the barn and staid there until the Cavalry came."

What was occurring back in Washington during this spectacular flight? What was the government doing to capture Lincoln's murderers?

Stanton, Secretary of War, on the morning of the fifteenth, had wired Colonel (later General) L. C. Baker, head of the Federal Secret Service: "Come here immediately and see if you can find the murderer of the President." Colonel Baker rushed from New York City accompanied by his cousin, Lieutenant L. B. Baker, also of the Secret Service. Handbills (already described) offering rewards and giving descriptions were issued, and Lieutenant Baker sent into lower Maryland to distribute the bills and look for clues.

From *Harper's Weekly*, May 20, 1865.

Ruins of Garrett's barn and outhouse near Port Royal, where Booth was shot.

At the same time, under the direction of Major-General C. C. Augur, infantry, cavalry, and detectives were dispatched into lower Maryland. Detectives under Lieutenant Alexander Lovett, after calling several times at the home of Dr. Mudd, obtained the story of Booth's and Herold's stay there. Another detective party under Major James R. O'Beirne went down the Potomac to Port Tobacco on the eighteenth, and meeting Major John M. Waite of the Eighth Illinois Cavalry they decided to explore the Zekiah Swamps, described so graphically by Major O'Beirne: "The swamps tributary to the various branches of the Wicomico River, of which the chief feeder is Allen's Creek, bear various names such as Jordan's Swamp, Atchall's Swamp, and Scrub Swamp. These are dense growths of dogwood, gum, and beech, planted in sluices of water and bog. Frequent deep ponds dot this wilderness place, with here and there a stretch of dry soil, but no human being inhabits the malarious expanse; even a hunted murderer would shrink from hiding there. Serpents and slimy lizards are the only living denizens. Not even the hunted Negro dared to fathom the treacherous clay."

The colored man who had seen Booth and Herold near the Potomac, reported his suspicions to some of Baker's detectives and was brought to headquarters. Baker at once requested a detachment of cavalry, which was sent to him under the command of Lieutenant Edward P. Doherty. Calling in Colonel E. J. Conger and Lieutenant L. B. Baker, of his force, Colonel Baker, according to the story given in his history of the Secret Service, published in 1867, told them that he had information that Booth and Herold had crossed the Potomac at the same time, pointing out with a pencil the place on a map where they had crossed and where he, Baker, believed they would be found. (See Baker's History of the Secret Service, published in 1867.)

The story as told from the reports of Lieutenant Doherty—Official Records Series 1 Vol. 46, Part 1, p. 1317—and the signed statement of Colonel Conger and Lieutenant L. B. Baker sent to Secretary of War Stanton, is that the troop proceeded down the river to Belle Plain where they disembarked about 10 o'clock the evening of April 24 and marched toward the Rappahannock, arriving at Port Conway about 2 p. m., Tuesday afternoon. Questioning the ferryman, Rollins disclosed the fact that Booth and Herold had been there the day before. Pictures of Booth and Herold were shown him which he recognized, but stated that Booth had no mustache. Rollins claimed that Booth offered him $10 to take them on to Bowling Green, fifteen miles away but that in the meantime three Confederates had come up and that Booth's attention was turned to them.

Rollins said that one of the Confederate officers, Captain Jett, was courting a lady whose father kept a hotel in Bowling Green and that the party had gone in that direction. At six in the evening the expedition was ferried across and moved on to Bowling Green. About midnight Captain Jett was routed out of bed and compelled to lead them to the assassins, twelve miles back to the Garrett place, where they arrived about 2 a. m.

The events at the Garrett barn have already been told by Richard Garrett, the father. They are, however, given more in detail by the officers of the expedition.

Seizing both Garrett boys the officers took them to the barn, compelling one to enter and demand the surrender of the fugitives. Young Garrett went in and, according to the testimony of Colonel Conger given at the conspiracy trial, came out very soon and said:

"'This man says, "Damn you, you have betrayed me," and threatened to shoot me.'

"I said to him, 'How do you know he was going to shoot you?'

"Said he, 'He reached down to the hay behind him to get his revolver, and I came out.'

"I then directed Lieutenant Baker to tell them that if they would come out and deliver themselves up, very well; if not, in five minutes we would set the barn on fire.

"Booth replied: 'Who are you; what do you want; whom do you want?'

"Lieutenant Baker said, 'We want you, and we know who you are; give up your arms and come out.'

"I say Booth; for I presumed it was he. He replied, 'Let us have a little time to consider it.'

"Lieutenant Baker said, 'Very well'; and some ten or fifteen minutes probably intervened between that time and anything further being said.

"He asked again, 'Who are you, and what do you want?'

"I said to Lieutenant Baker, 'Do not by any remark made to him allow him to know who we are; you need not tell him who we are. If he thinks we are rebels, or thinks we are his friends, we will take advantage of it; we will not lie to him about it, but we need not answer any questions that have any reference to that subject, but simply insist on his coming out, if he will.' The reply was made to him, 'It doesn't make any difference who we are; we know who you are, and we want you; we want to take you prisoners.'

"Said he, 'This is a hard case; it may be I am to be taken by friends.'

"Some time in the conversation he said, 'Captain, I know you to be a brave man, and I believe you to be honorable; I am a cripple. I have got but one leg; if you will withdraw your men in line one hundred yards from the door, I will come out and fight you.' Lieutenant Baker replied that we did not come there to fight; we simply came there to make him a prisoner; we did not want any fight with him.

"Once more after this he said, 'If you'll take your men fifty yards from the door, I'll come out and fight you; give me a chance for my life.' The same reply was made to him.

"His answer to that was, in a singular theatrical voice, 'Well, my brave boys, prepare a stretcher for me.'

"In the meantime, I requested one of the Garretts to pile some brush up against the corner of the barn—pine boughs. He put some up there, and after awhile came to me and said, 'This man inside says that if I put any more brush in there he will put a ball through me.' 'Very well,' said I, 'you need not go there again.' After a while Booth said, 'There's a man in here wants to come out.' Lieutenant Baker said, 'Very well; let him hand his arms out, and come out.' Some considerable talk passed in the barn; some of it was heard, some not. One of the expressions made use of by Booth to Herold, who was in the barn, was, 'You damned coward, will you leave me now? Go, go; I would not have you stay with me.' Some conversation ensued between them. . . . It was not heard; we could simply hear them talking.

"He came to the door and said, 'Let me out.' Lieutenant Baker said to him, 'Hand out your arms.' The reply was, 'I have none.' He said, 'You carried a carbine, and you must hand it out.' Booth replied, 'The arms are mine, and I have got them.' Lieutenant Baker said, 'This man carried a carbine, and he must hand it out.' Booth said, 'Upon the word and honor of a gentleman, he has no arms; the arms are mine, and I have got them.' I stood by the side of the Lieutenant and said to him, 'Never mind the arms; if we can get one of the men out, let us do it, and wait no longer.' The door was opened, he stuck out his hands; Lieutenant Baker took hold of him, brought him out, and passed him to the rear. I went around to the corner of the barn, pulled some hay out, twisted up a little of it, about six inches long, set fire to it, and stuck it back through on top of the hay. It was loose, broken-up hay, that had been trodden upon the barn floor. It was very light and blazed very rapidly—lit right up at once.

"I put my eye up to the crack next to the one the fire was put through, and looked in, and I heard something drop on the floor, which I supposed to be Booth's crutch. He turned around toward me. When I first got a glimpse of him, he stood with his back partly to me, turning toward the front door. He came back within five feet of the corner of the barn. The only thing I noticed he had in his hands when he came was a carbine He came back, and looked along the cracks, one after another, rapidly. He could not see anything. He looked at the fire, and from the expression of his face, I am satisfied he looked to see if he could put it out, and was satisfied that he could not do it; it was burning so much. He dropped his arm, relaxed his muscles, turned around, and started for the door at the front of the barn. I ran around to the other side, and when about half round I heard the report of a pistol.

"I went right to the door, and went into the barn and found Lieutenant Baker looking at Booth, holding him or raising him up, I do not know which. I said to him, 'He shot himself?' Said he, 'No, he did not either.' Said I, 'Whereabouts is he shot—in the head or neck?' I raised him then, and looked on the right side of the neck, and saw a place where the blood was running out. I said, 'Yes, sir, he shot himself.' Lieutenant Baker replied very earnestly that he did not. I then said, 'Let us carry him out of here; this will soon be burning.' We took him up and carried him out on the grass, underneath the locust trees, a little way from the door. I went back into the barn immediately to see if the fire could be put down, and tried somewhat myself to put it out, but I could not; it was burning so fast and there was no water and nothing to help with. I then went back. Before this, I supposed him to be dead. He had all the appearance of a dead man; but when I got back to him, his eyes and mouth were moving. I called immediately for some water, and put it on his face and he somewhat revived and attempted to speak. I put my ear down close to his mouth and he made several efforts to speak, and finally I understood him to say, 'Tell mother I die for my country.' I said to him, 'Is that what you say?' repeating it to him. He said, 'Yes.'

"They carried him from there to the porch of Mr. Garrett's house and laid him on an old straw bed, or tick or something. By that time he revived considerably; he could then talk in a whisper, so as to be intelligently understood; he could not speak above a whisper. He wanted water; we gave it to him. He wanted to be turned on his face. I said to him, 'You cannot lie on your face,' and he wanted to be turned on his side; we turned him upon his side three times, I think, but he could not lie with any comfort, and wanted to be turned immediately back. He asked me to put my hand on his throat, and press down, which I did, and he said, 'Harder.' I pressed down as hard as I thought necessary, and he made very strong exertions to cough but was unable to do so—no muscular exertion could he make. I supposed he thought something was in his throat, and I said to him, 'Open your mouth and put out your tongue, and I will see if it bleeds.' Which he did. I said to him, 'There is no blood in your throat; it has not gone through any part of it there.' He repeated two or three times, 'Kill me, kill me.' The reply was made to him, 'We don't want to kill you; we want you to get well.'

"I then took what things were in his pockets, and tied them up in a piece of paper. He was not then quite dead. He would—once, perhaps, in five minutes—gasp; his heart would almost die out, and then it would commence again, and by a few rapid beats would make a slight motion. I left the body and the prisoner Herold in charge of Lieutenant Baker. I told him to wait an hour if Booth was not dead; if he recovered, to wait there and send over to Belle Plain for a surgeon from one of the gun-ships; and, if he died in the space of an hour, to get the best conveyance he could and bring him on.

"I stayed there some ten minutes after that was said, when the doctor there said he was dead."

(A knife, pair of pistols, belt, holster, file, pocket compass, spur, pipe, carbine, cartridges, and bills of exchange were shown to the witness and identified by him.)

The bill of exchange was on the Ontario Bank, Montreal branch, for £61 12s 10d, made payable to John Wilkes Booth.

The orders had been to take Booth alive, if possible, and Sergeant Boston Corbett of the Cavalry Detachment, who shot him, when reprimanded explained in his testimony that, "I saw him (Booth) make a movement toward the door. I supposed he was going to fight his way out. One of the men, who was watching him, told me that he aimed the carbine at me. He was taking aim with the carbine, but at whom I could not say. My mind was upon him attentively to see that he did no harm, and when I became impressed that it was time I shot him. I took steady aim on my arm, and shot him through a large crack in the barn."

After making certain Booth was dead they sewed him up in a saddle blanket. An old Negro living in the vicinity had a horse. To this was harnessed a ramshackle wagon. The corpse was tied with ropes around the legs and made fast to the wagon. In this rickety vehicle the body of John Wilkes Booth journeyed back again to the Potomac River.

Herold and the body were loaded on the steamer *Ide*, carried to Washington and placed for safe-keeping on a gunboat.

About 1872 John St. Helen asserted that he was John Wilkes Booth. His story will be discussed in the next installment.

World Cotton Control by Sapiro Plan

Concluded from page 4

210,606 bales were imported. In this year of 1919, there was an organization by the department of agriculture in the South urging the farmers to hold their cotton. The result of this was that cotton prices advanced $35 a bale, and later advanced $45 a bale more, until the spinners closed their mills and set up the cry of "poor trade."

In 1924, with the world at least nominally at peace, and with the lowest visible supply in many years, cotton declined $35 a bale on an estimate of a 12,500,000-bale crop, the same estimate on which it had risen a total of $80 a bale in price five years before. In 1924, however, there was no agricultural organization to sustain the farmer in the South; he could not get money from the reserve or intermediate credit banks; he was unable to hold his cotton, and the *orderly marketing scheme of the Sapiro Plan Texas Farm Bureau Association was operating full strength.* Instead of giving the farmer the benefit of such an advance in price as would follow his holding of his cotton, the Sapiro Plan association agrees with the Jewish bankers of New York to dump a minimum of 10 per cent of the cotton it handles every month on the market, irrespective of price offered or of prospective demand in the months to come.

Meanwhile, the Texas cotton-planters who are in the Texas Farm Bureau Cotton Association will be paying interest on ten million dollars borrowed by the Sapiro Plan association, not to help them to live until they can sell their crop for a sum sufficient to show a profit on the cost of production, but to help them market a crop at prices which Jewish bankers, the future gamblers, the spinners, and the Sapiro-controlled Gentile masters of the cotton association dictate.

Yet the Sapiros, the banking ring, the Sapiro Plan coöperative associations, and the newspapers subsidized by Jewish advertising, have denied repeatedly that the Jewish financial powers had any connection whatever with the Sapiro Plan of coöperative agricultural marketing. Out of the mouths of Goldman, Sachs and Company at last comes the truth of the whole scheme, a truth which has been repeated in these columns ever since the investigation of the Sapiro Plan coöperatives was inaugurated.

If the price of cotton were made stable, or even reasonably so, there would be little or no gambling in cotton futures, for the gamblers interested in future dealing would have no price-variant on which to bet. It would not be to the interest of these gamblers—many of whom are interested closely in the schemes of the Jewish ring of international bankers—either to "bull" the market to higher price levels, or to "bear" it to lower figures. The cotton-planter and the spinner then would have the opportunity to come together on a price which would leave the producer a fair profit on his production costs, and the spinner a reasonable price on which to base his ultimate sales price. Nothing could be further from the desires of the cotton speculators or the bankers than a comparatively small sum in the total value of the production of America's farms. What they are pleased with is the "orderly marketing" plan of Mr. Sapiro, and the fact that they can lend this money and still dictate to the farmer that he shall not use it to support himself until his cotton can be sold at a profit. All the Texas cotton-planter has to do is raise his cotton, pay the cost of production, deliver it to the Sapiro Plan association,

> COOPERATIVE MARKETING ASSOCIATIONS, the majority of which are organized and operated on the Sapiro Plan, have started a movement to obtain control of the agricultural industry of California through control of that state's department of agriculture. A resolution calling upon the state legislature to submit to the electors in 1926 a constitutional amendment creating an agricultural council to govern, direct, and control the state department of agriculture was adopted by a convention of representatives of these cooperative associations at Sacramento, December 10, 1924.
>
> The plan calls for a council of nine members, to be appointed by the governor for *terms of twelve years*, three being appointed every four years. This council, which is proposed to be selected from members and officials of the cooperatives, would appoint the director of the state department of agriculture, and thus take that department completely out of the control of the state government, and the people, and place it in the hands of the ring which dominates the agricultural cooperative marketing associations in California. The pretext under which the scheme is being presented is that it "will take the department of agriculture out of politics."

pay interest to the alien banking ring, and take whatever he is paid when his cotton happens to be in the 10 per cent lot which is to be unloaded in that particular month. The speculating will be attended to by the cotton-futures gamblers, the alien bankers, and others who have assisted in throwing and tying up the farmer. And the money with which they speculate will be in large part furnished by the interest which the farmer has paid on that ten million dollars!

The international bankers do not want the price to be profitable to the farmer, else he will pay off his indebtedness and will contribute no more interest to their coffers. Therefore, the future "speculators" and the international bankers work together for "orderly marketing," and Aaron Sapiro furnishes the plan, the organizations, and the contract-bound farmers to insure it.

Look closely at the agreement by which the Texas Farm Bureau Cotton Association (Sapiro Plan) has bound itself to Wall Street. More than 200,000 bales of cotton are to be handled, on a revolving credit of $10,000,000. This is, roughly, $50 a bale. This means that enough cotton must be sold, and must keep on being sold throughout the term of the contract, to keep this figure down to $50 or less a bale for the whole lot. To assure the money powers that this will be done it is specifically stated that "all cotton acquired from its (the Texas Farm Bureau Cotton Association) members during the 1924-25 season will be sold at a minimum average monthly rate of ten per cent of the estimated cotton receipts for the season." That is to say, on a basis of 200,000 bales handled, 20,000 bales must be sold, willy-nilly, regardless of price, cost of production, desires of the owner and producer, or anything else except the demands of the controllers every month.

This means, also, that approximately one million dollars or more of the ten million will be returned to the "revolving credit" every month during the time the contract runs. It is one thing to borrow ten million dollars for ten months and repay it all at the end of the ten months, but quite another thing to repay the ten million at the rate of one million a month, so that the million paid in every month may be re-loaned to some other fellow immediately. This is the form of financiering on which the salary-loan shark companies, and similar schemes, are conducted.

Let us remember, too, as in the case of the other Sapiro Plan coöperative marketing associations, that *every member of the association is bound to pay his share of the interest on money borrowed by the association, and of the principal, too, if need be, whether or not he himself ever has used a cent of the money, or even made application for a loan.*

As usual, the newspapers of Texas are failing to publish the truth of this deal, or even the truth about the operations of the Sapiro Plan coöperative marketing associations in that state.

This muzzling of the press has accompanied the organization and operation of every other Sapiro Plan coöperative with which the writer has come into contact. A number of independent cotton-planters, business men and other responsible persons in Texas have been endeavoring, ever since the Texas Farm Bureau Cotton Association was formed, to present the truth of this situation to the people through the press of the state, but have been unable to persuade the newspapers even to investigate conditions, far from publishing anything concerning the association. Yet when the Jewish banking ring appeared in the field with its ten million dollar revolving credit scheme, these newspapers gave columns of space to articles laudatory of it and of the Sapiro Plan!

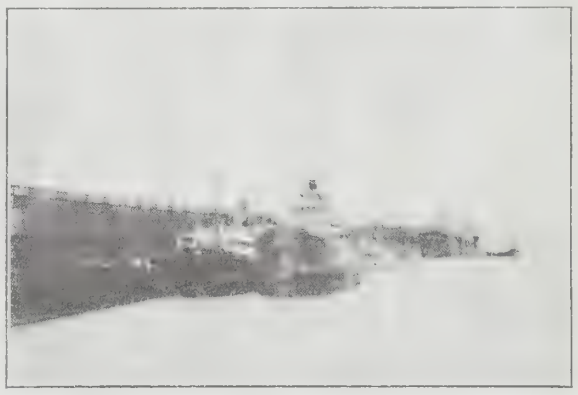
The summarized truth of the Texas situation is just this:

The Jewish banking ring has offered to lend to a Sapiro-Plan coöperative cotton marketing association—and to no one else—ten million dollars, on the guaranty that a certain amount of cotton will be marketed at a fixed average rate per month.

The Sapiro Plan cotton association has bound its members, the supposed free men of Texas, to deliver all their cotton to it for five years, and to sign away all their right and interest in the time of sale or price received for that cotton.

Here is the most brilliant example the writer has yet uncovered of the manner in which the Jewish financial organization, working with and through an association organized, dominated and controlled by another Jew, is exploiting the American farmer. Thus, out of Texas comes the confessed truth of the charge, made frequently in this series of articles, that the international banking ring is endeavoring to obtain control of America's agricultural production, to exploit it for the profit of that ring.

An old-time cotton market on the banks of the Mississippi River, in the days before the Jewish domination of the industry, when the planter fixed the price and time of sale of his cotton.



Deep-sea steamers and sailing ships tied up at the wharf at New Orleans, waiting to load export cotton for shipment to Europe and the United Kingdom.

this condition of stability in the price of cotton, or of any other staple crop. The Sapiro Plan coöperative marketing associations play directly into the hands of these bankers and speculators. They played into them in the prune districts of California, the wheat fields of the State of Washington, the bean farms of Central California, and now they are playing into them in the cotton plantations of Texas.

From the point of view of the international banker, it would be a calamity for the farmer and the consumer to get together to such an extent that the farmer would receive his costs of production and a reasonable profit on his crops, because this would create a surplus of money in the agricultural districts; farm mortgages would be paid off in place of being renewed, and there would be money in these districts to be loaned to any who might need it, without calling in the aid of the Jewish bankers. A surplus of money in the hands of the farmers of America would make for lower interest rates, and for "idle money"—which are as much desired by the bankers as are the visits of the boll weevil by the cotton planters.

The majority of the schemes which have been used to thwart the farmers of America from coming into direct contact with the consumers of their products, and thereby fixing their own prices for their non-perishable crops, have been fostered and carried on by Jewish bankers and their Gentile business associates. They have found that the Sapiro Plan coöperative association, which takes from the farmer all control over his product, is an ideal medium through which to work against the farmer, while appearing technically to be aiding him, just as Goldman, Sachs and Company make it appear that they are assisting the member of the Texas Farm Bureau Cotton Association to market his crop. As a matter of fact, by this loan, these banks are forcing the member of the Sapiro Plan association to submit to the dumping of his crop, at a regular average amount a month, at prices approved of by the Jewish bankers and by the other exploiters of American agriculture.

These bankers are not so particularly pleased at the opportunity to lend ten million dollars, because that is

Things in the Making—STEEL PENS

By FRANK DORRANCE HOPLEY

THERE is, perhaps, nothing more commonly used by everyone than the steel pen. While in the business office the typewriting machine has supplanted the pen, to a large extent, it is still used by the individual. Millions of pens are sold every year, and yet the people who buy them have not the slightest idea how they are made, how long it takes to produce one, or the process through which this bit of steel must pass before it is ready for the market.

It is a long stretch of imagination from the blazing lump of steel to the fine-pointed, delicate strip, which is inserted in the holder.

The steel is first rolled into great sheets, many feet square, and then is cut by a machine into strips about three inches wide. This steel is very brittle and could not be worked without danger of breaking. To overcome this difficulty the steel is now annealed; that is, the strips are heated to a red heat and then allowed to cool very gradually. When cold, the brittleness has disappeared and the steel is soft enough to be easily worked.

The strips of steel are again rolled to get them to the required thickness, or rather thinness. If the average person were asked, "How thin is a pen?" the majority could not tell. In reality, the average steel pen is not thicker than a thin sheet of letter paper.

The blank pen is now cut out of the thin, flat strip. On this the name of the brand or maker is stamped. Next the pen is molded in a form which combines gracefulness and strength. The rounding of the pen enables it to hold just the right amount of ink and to distribute it more gradually than could be done with a flat blade.

Did you ever wonder why there was a little hole in the end of the slit? This serves to regulate the elasticity, and also facilitates the running of the ink. If it were not there the ink would come in drops, and the paper be spattered and blotted.

Now the pen must be hardened again, for with a pen made of soft steel no one could write. It must also be tempered.

The pen is heated to a cherry red and it is then plunged into some cool substance, such as water. At once a change occurs in the quality of the metal. It goes suddenly from a soft, lead-like substance to a brittle, springy one. The temper of the steel must now be drawn, else it would be too brittle.

The man who does this must have a sense of colors He must not be color blind, for the drawing process, as it is called, consists of heating the pen until it reaches a certain color.

The first color that appears is that of straw. This changes rapidly to a blue. The elasticity of the metal changes with the color, and it may be fastened at any point by the instant plunging of the pen into cold water. An expert can tell by the exact shade of blue of the pen, just what the elasticity of the steel is.

The polishing of the pens is done by putting them into revolving barrels, which contain sand or sawdust. To be sure that they are absolutely smooth, they are afterward ground against a revolving emery wheel.

The last, and one of the most important mechanical operations is slitting the pen point. The machine which accomplishes this is of special design and construction, with very delicate parts. It is called a shearing machine.

Now comes the final burnishing, and, in some cases, lacquering, to prevent rust.

The pens are then ready to be sorted, boxed, and packed for shipment to the ends of the earth.

THE LIBRARY OF THE
UNIV. OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. The set includes: "The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

Wine sold for three cents a quart in the early Roman Empire days.

The distance around the boundary of the United States is 13,156 miles.

Arabs cast trees into their bitter inland seas as Moses bade his people do. The salt crystallizes about the boughs and the bitterness of the waters grows less.

The six marshals of France at the present time are Joffre, Foch, Petain, Lyantey, Franchet d'Esperey, and Fayolle.

Conrad had the choice of at least three languages for his novels—Polish, French, and English. He chose English, and though he wrote letters in French, he left the French translations of his works to others.

Miners in the Tahoe National Forest working a gold mine, 3,000 feet below the lava cap of the Sierra peaks, came across an old flood deposit in which were the tangled logs of a group of sequoias in a perfect state of preservation.

A portrait of President Harding adorns the new one-and-one-half-cent stamp designed for use on third-class mail matter under the new postage rates. A one-half-cent stamp carrying a profile of Nathan Hale will be sold to take care of those who have on hand a supply of the old one-cent stamps.

Haydn, the musical composer, to present proof of his eligibility to Oxford University, submitted a musical cross-word puzzle, a composition which, read backward or forward, up or down, from its beginning or end, was always a melody with an accompaniment.

Forty-two youngsters, three, four and five years old, sleep, play, and eat under expert care in a day nursery maintained in connection with the University of Chicago, while their parents go on with classroom courses or research work.

Ten per cent of the people in the country buy for cash; 30 per cent buy on credit, and 60 per cent make their purchases upon the installment plan.

With a roar heard five miles away, an oil well came in near Beaumont, Texas, drenching the owner of the land, a poor Negro, and his eleven children, some of whom played gleefully in the dark, heavy fluid, which had taken them to wealth at the rate of $2,000 daily.

A slaughtered camel with its stomach opened in the Sahara indicates that the Saharan has killed his camel to get a little green water to keep him alive; and unless the act was recent the body of the man will be found not far away.

An American woman, divorced from an alien husband, has the right to have her American citizenship restored, according to a ruling of Judge Morton in the Federal Court in Boston.

Leif Ericson's "Vinland" was Virginia, according to a new method of interpreting astronomical observations made by Ericson.

Pedestrians have the right-of-way over motorists outside the central traffic zone in Los Angeles. One afoot desiring to cross a street at any intersection not under police control signals his desire by holding up his hand to approaching motorists.

Two fighting-planes collided a mile in the air at Kelly Field, San Antonio, Texas, recently. The pilots leaped, fell swiftly for hundreds of feet, opened their parachutes and floated down side by side to safety, while the two ships hit the earth with thundering crashes and burst into flames.

Jewelry robbers in 1924 increased 50 per cent over 1923.

"I Read in the Papers—"

I read in the papers that a Detroit clergyman of unusual vision and power protests that "Rain" is unfair to missionaries, that the missionary of the play is not typical, that there are hundreds of missionary statesmen, missionary doctors, missionary teachers and saints and farmers of whose existence the author of "Rain" seems to be wholly unaware. As the story of a churchman who sets out to save a fallen woman and ends by losing himself, it fails to rise to any height achieved by others who have essayed that theme, of which "Thais" is the greatest. And so on. A most just criticism and much needed.

But what of it? This thing is flaunted in the face of Christian America every week—and it is only one of many—for no discoverable purpose unless to destroy public respect for Christianity. Well, why do not the ministerial critics say so? This one is quoted as saying in the course of his sermon, "A play which does not make a minister a freak, or religion a chance for a laugh and a sneer, is, in the long history of the American stage, the exception and not the rule."

Certainly. THE DEARBORN INDEPENDENT said that some years ago. Look at "Rain" and you will see that the producer is Sam H. Harris. It doesn't matter who the author is. Authors to get their plays on the stage must get past the Jewish producers, they must pander to the Jewish producers' anti-moral and anti-Christian purposes. You can get almost anything on the stage that makes a saint out of a Jew peddler or a lecherous hypocrite out of a Christian. And the Americans and Christians pay for it! They pay the bills and the Jew producers roll up the profits.

Now, what good is it for men like this minister (who are horrified at mention of the Jew, for they consider it "racial prejudice")—what good is it for them to play delicately around the edges of the situation? The facts are before their eyes; why don't they tell the people what they are? Sam Harris stages every night a virulent attack on the Christian missionary. And Americans let Sam Harris go and criticize the "stage." Take the velvet out of your mouths, gentlemen, and let spades be spades.

I read in the papers, almost continuously these days, matter concerning Count Karolyi. It is more than strange how a foreign radical can command attention from ocean to ocean in the American press. No American's legitimate interest could command anything like the extent of Karolyi's publicity. I wonder why? I wonder if American editors ever stop to wonder why? I wonder if American editors ever wonder what would happen if some day they should conclude to shut down on that sort of stuff? The intention plainly is to play horse with the government and draw it into the mess of falsehoods that have been thrown around the case. The method of the alien is to invent falsehoods calculated to arouse the American's sense of fairness. The United States Government permitted Countess Karolyi to come in, in spite of her record; it also permitted the Count to come in, because of the Countess' illness. And what it receives in exchange is abuse and an organized attack through the American press. But the worst feature of the affair is that Americans see nothing sinister in it. They take it as "news."

I read in the papers that President Coolidge has decided to try to enforce prohibition at the liquor sources. That is, he will guard the liquor stocks and watch the coast and boundaries, and let local authorities take care of the local situation. So far so good, if it means anything. The drum-fire of the press campaign against prohibition is beginning to have its effect in some quarters. The mental fatigue which such campaigns are planned to induce is setting in. There is need, on sound national grounds, for some authority to sound a new note, namely, that *the way out is ahead.* Prohibition in its present form may not be final. But government partnership in the business of alcoholic debauchery will never return. The best discussion of the history of prohibition that I have ever seen is in volume 4 of the series published by THE DEARBORN INDEPENDENT, "Aspects of Jewish Power in The United States." In prohibition we seem to be repeating some of the experiences of the Abolition of Slavery. Lincoln wanted to emancipate the slaves by purchase. His plan would probably have prevented or greatly shortened the Civil War. There are still millions of dollars' worth of privately owned liquors and wines in the country, and the owners are trying to get their investment out of them. Could the government buy this stuff or, failing to buy it, place it under military guard, much of the present difficulty would be removed.

I read in the papers that Sir Arthur Keith says the brain of man is steadily decreasing in size. The modern man has no pressing problems, according to Sir Arthur, such as the primitive man had to face. He buys his clothes, food, automobiles, radio sets, philosophy, patent medicines, news, and so forth, instead of making them himself, as Australopithecus probably did.

If he wants light or power, he hires electrical engineers to construct great dams, harness rushing rivers to generators. If he feels the need of shelter for himself and his affairs, he hires an architectural engineer to run up a few miles of steel skyscraper. If he wants to go somewhere in a hurry, he hires an airplane. Naturally, having everything taken off his hands this way is making man, personally, small-brained and relatively dumb.

No getting round that. But who furnishes the brains to make the automobiles, philosophies, medicines, radio, engineering and architectural works and airplanes? And who furnishes the brains by which the need of these things is felt? And who furnishes the brains to use them? There is no getting round this either, and it leaves Sir Arthur Keith somewhat up in the air.

PEOPLE of the present age are somewhat skeptical regarding "prophets." For example, there is that form of "prophet" who is constantly searching the writings of old trying to interpret something new. Obscure phrases are transformed into forecasts of the end of the world, and the "prophets" generally live to be laughed at. But we seldom hear of a prophet of earthquakes. There is one, however, and what is more, his prophecies have been coming true. Readers may judge for themselves by reading the interview with Dr. Milton A. Nobles. (pp. 2 and 6)

THERE is no more interesting church in the United States than the Old North Church of Boston. A reproduction of a delightful pencil sketch of the ancient structure accompanies the article. (p. 3)

FROM quite an early period Britons have been in the habit of declaring that they "never, never, shall be slaves!" This proud boast is being tested by a bill at present before Parliament by which it is sought to deprive them of the freedom of the air. "Radio-bootlegging" may be the result. (p. 4)

SOMEONE once asserted that the site of the Garden of Eden was in the State of Ohio. Others favor the wilds of Manchuria, but the latest location claimed as the cradle of the human race is Bechuanaland, South Africa. (p. 5)

SOME incisive comments on the present political situation in this country are not out of place. In this case the pen has been reinforced by the pencil of the cartoonist, and the combination is distinctly interesting. (p. 6)

ON PAGE 6 also there is another of the McGuffey maxims which should have a very wide appeal. Such lessons as those told by "The Birds Set Free" never grow old.

TIMELY remarks on finance are always acceptable. One of the things that the investor has to beware of is the buying of fake stock. He must see to it whether he is on the "sucker list." Another thing is making himself acquainted with the ins and outs of the currency system; just what the term "money" means. (p. 9)

BY CLOSELY following this week's installment of the articles relating to Lincoln's assassination, the reader will be able to judge what value can be placed on the "confession" of John St. Helen that he was no other than the assassin, John Wilkes Booth. So many myths have recently grown up regarding the details of this chapter in national history, that it is well to have it thoroughly analyzed. (pp. 10, 11, 13)

PAUL REVERE, when he left behind him a graphic but still matter-of-fact account of his ride to Lexington, never dreamed that he would be immortalized by Longfellow, but fact has a power that cannot be excelled. Paul Revere speaks for himself. (p. 12)

A WESTERN town took hold of a bit of useless land and made it a valuable asset. (p. 15)

He Is the Prophet of Earthquakes

Dr. Milton A. Nobles, Who Says the Greatest Cataclysm Is Yet to Come

By PIERCE CUMINGS

MY FRIEND, Dr. Milton A. Nobles, telephoned me the other night. It was, to be precise, 9 o'clock on the evening of January 27.

"I just called," he said, "to tell you that there will be an earthquake somewhere south of us tonight or tomorrow. It is due during the night but may not come until morning. It will be in the northern part of South America or in Central America, probably the latter."

Now let it be known that Dr. Nobles is probably the only successful prophet of earthquakes in the country, if not in the world.

He is, incidentally, a physician, a geologist of note, a Bible scholar, an expert on Indian relics and he is versed in the science, or the art, of austromancy—which, as you probably have forgotten, is divination by winds. But it is as a foreteller of earth tremors and volcanic eruptions that he is best known.

We chatted for a time on other matters, and then he returned to one of his numerous avocations, while I duly recorded his forecast for the newspaper with which I am connected.

The next day the Associated Press carried the following dispatch:

> Washington, Jan. 28—Two pronounced earthquakes were recorded on the seismograph at Georgetown University here last night and early today.
>
> Father Tondorf announced the first quake began at 11:20 p. m., continuing until about 1 o'clock this morning, with maximum tremors at 12:10 a. m. He estimated the distance of this quake at about 5,400 miles from Washington. The second quake reached a maximum from 6:16 to 6:20 a. m., ending at 6:45. The distance of the second quake was not ascertained.

Foretold Great Japanese Earthquake

Further confirmation of Dr. Nobles' prophecy came on the following day, when the Associated Press carried this story about the tremors:

> Mexico City, Jan. 29—Reports from Vera Cruz regarding the violent earth shocks in that state at 2:25 a. m., Wednesday, state no news of any casualties or material damage had been received. The authorities of the Vera Cruz seismological station, who expressed the belief that the center of the disturbance was near that port, connected the shocks with the renewed activity of the volcano Popocatepetl.
>
> There is natural fear among the population, the advices add, of a repetition of the disaster of 1920, when several villages disappeared with the loss of hundreds of lives, and marked changes occurred in the configuration of the surface in some sections.

And thus Dr. Nobles' prophecy came to pass within a remarkably short space of time. Mere coincidence? Possibly. And yet this same Dr. Nobles has predicted earthquakes and volcanic eruptions and disastrous floods during the past twenty years with startling accuracy!

The great Japanese earthquake was forecast by Dr. Nobles in a message to a New York newspaper several hours before the catastrophe took place.

"A portion of Japan probably will sink into the ocean exactly as though cracked off," his telegram said in effect. "Possibly whole islands will go."

And the editors of the newspaper, having witnessed the uncanny fulfillment of his prophecies before, immediately flashed him word to wire them all information possible. The cataclysm occurred a short time after his story was received, although details of it did not reach this country until hours later.

These facts would indicate that Dr. Nobles is an extraordinary man. Attention has been directed at him many times because of his bizarre statements. Men have laughed at him. But they also listen.

Because of his remarkable success at augury, many are paying serious heed to the most astounding of his predictions, one which appears absurd at first thought, and yet one which, it is declared, even now seems in the process of being partially fulfilled.

In brief it is this:

The world is destined to witness a cataclysm comparable only to the great deluge of Noah!

Third of the Earth Will Vanish Under the Sea

One-third the surface of the earth will crumble under the sea.

A new continent will arise, probably where the South Sea Islands now are.

Japan, China, parts of Southern Asia, most of the countries of Europe, Northern Africa and portions of land in the Arctic Circle will disappear under the waters.

The toll of life will be stupendous.

"You may live to talk about the millions of people who were lost," Dr. Nobles once said to me. "It may even come during my lifetime. Or it may not come until years, or generations, after we both are dead."

Many scientists deride Dr. Nobles as a crank. They laugh at his theories about the earth's crust or about the winds or about the volcanic activities beneath the surface, declaring them ridiculous and untenable. But this strangest of prophets merely smiles and continues to make his weird forecasts. And then he sits back to wait for them to come true, knowing with a confidence bred of experience that in all likelihood they will!

Dr. Nobles is a student of cosmography. The dark, little room which is his workshop is filled with maps, old German maps, or English ones, or French, and with scuffed, well-worn tomes on the earth's substance, many of them dating back hundreds of years.

Often he will emphasize a point by drawing from one of the shelves a French or an Italian chart of two or three centuries before.

"See," he exclaims excitedly, tracing certain features of the map. "These are not shown on our modern maps! And why? Because the world's surface is constantly changing, constantly changing. They don't exist any more."

Dr. Nobles has a reputation as a geologist and has conducted important surveys. For years he was a practicing physician. He obtained his M. D. from Syracuse nearly a half-century ago. In appearance he is picturesque, patriarchal, with a scraggly white beard, and sharp, piercing eyes. Were it not for a merry laugh and a deprecating sense of humor, he might remind one of the alchemists of the Middle Ages, so intent he is and so serious.

DR. MILTON A. NOBLES.

Dr. Nobles keeps no record of the outcome of his own prophecies. This he leaves to others.

"It is like kissing a girl," he explained. "It's fun while it lasts, but what good does it do afterward to make an entry in some notebook: 'This afternoon I kissed Mary Jane?' That only destroys the pleasure of it."

Gave Warning of Floods on Mississippi

And so Dr. Nobles keeps no record of his prophecies. Abundant proof of the accuracy of his predictions, however, is furnished in the contemporary newspaper accounts about the man.

Nearly thirteen years ago the *Public Ledger*, that staid and delightfully respectable journal which still boasts of itself as "the Philadelphia Bible," had this to say about him under date of August 18, 1912:

> "It is believed that Dr. Nobles is the only man who has ever mastered the study of the forces of nature sufficiently to be able to predict earthquakes."

> **The world is destined to witness a cataclysm comparable only to the great deluge of Noah.**
>
> **One-third of the surface of the earth will crumble under the sea.**
>
> **A new continent will arise, probably where the South Sea Islands now are.**
>
> **Japan, China, parts of Southern Asia, most of the countries of Europe, Northern Africa, and portions of land in the Arctic Circle will disappear under the waters.**
>
> **The toll of life will be stupendous.**
>
> **This summarizes the words of Dr. Milton A. Nobles, "a prophet of earthquakes," whose predictions of the great Japanese earthquake and other cataclysms have been startlingly verified.**

The particular story in which this statement appears had to do with the great earthquake in Turkey, which occurred just about that time. It continued:

"Dr. Nobles foretold the disastrous earthquake in Turkey; forecast that in San Francisco; the great earthquake in Sicily; and several great South American earthquakes as well."

Surely all these could scarcely be put down as mere coincidences. But they are by no means all. That Dr. Nobles is that rare specimen, a prophet with a modicum of honor in his own land, is further shown by another Philadelphia newspaper, the *North American*, which, not to be outdone by its rival, boasts the fact that it is the oldest daily newspaper in America and was founded by none less than Benjamin Franklin.

In the middle of April, 1922, the Mississippi Valley was swept by one of the worst floods in its history. Levees were washed away all along the mighty waterway. Hundreds of families were rendered homeless. Thousands of acres of land were inundated.

All this was foreseen by Dr. Nobles, who sent the following letter to the *North American* on March 27, long before the disastrous rainfalls had set in, or had even been thought of by others:

"An area of intense volcanic activity is rapidly developing in the Gulf of Mexico. It will produce a great rainfall in the entire Mississippi Valley and its tributary valleys, probably exceeding in sum the rainfall of the Dayton flood, and attended in the nearer coastal areas by violent tornadoes on each side of the Mississippi.

"The climax should be well within the coming thirty days. I have no idea that the great 'earthworks' constructed to confine the flood waters will do more than substitute a sudden calamity for that which would have been, naturally at least, less sudden."

The letter of warning was received some weeks before the beginning of the river's rampage. After printing stories for several days about tornadoes and unprecedented rains and floods, the newspaper said:

"It is usually the fate of prophets to be remembered only when their prophecies fail to come true. So there are two reasons why Dr. Nobles may have a melancholy satisfaction in considering the floods that now inundate the Mississippi levees, and threaten life and property."

For fifty years, and longer, Dr. Nobles has made a study of meteorological conditions. He bases his predictions largely on his own observations and the deductions he draws from these observations. Some of his theories are akin to the accepted beliefs of the world's leading scientists. Others are so bizarre and extravagant as to be classed by these gentry as preposterous.

For this reason, in analyzing his hypotheses, it is well to bear in mind that, whereas he has been amazingly successful so far in the fulfillment of his prophecies, that fact alone does not constitute proof that his theories are correct, or that his predictions of dire calamity will come to pass.

World Undergoes Process of Renewal

But because of this eerie power of prophecy that the man possesses, it is at least highly interesting to note his views.

The world, Dr. Nobles says, undergoes a process of rejuvenation at stated periods.

"When a continent has become worn out as a habitation for man," he declares, "its fertility gone and its usefulness exhausted, it seems to be Nature's policy to submerge it in the ocean while raising new continents for man's residence. The submerged land goes through the rejuvenating process and finally rises again, rich in salts and minerals, to support vegetable and animal life."

The deluge of Noah's time, the story of which has been corroborated by the recent unearthing of ancient tablets, was merely an example of the workings of this process, he thinks. And the catastrophe which he foresees will be of similar nature.

Volcanic activity, he says, is always accompanied by heavy rainfall.

The discovery of America and its settlement by the sturdier races of Europe, the great flood of immigration here in recent years, the development of the American penchant for bringing the great works of art of all the world to this country, and the World War are all parts of the Great Plan which will culminate in the new Deluge, he believes.

"For four hundred years," he says, "the fittest people of the doomed areas of the Old World have been swarming to America. They have been coming here in incredible numbers. Why? Because the American continents have been rejuvenated, they are fresh and rich.

"And the World War—it is my personal opinion that this conflict came that the more virile of these people in the doomed countries might be given an opportunity to pass into the Great Unknown through patriotic defense of their homes, rather than perish by quake and fire."

Ridiculous? Possibly. But these are given as conjectures only by Dr. Nobles, not as facts.

And now how is this great catastrophe to come about?

The world, so Dr. Nobles believes, has changed its appearance many times. Each upheaval has been accompanied by the establishment of a new Equator, and gradually around each Equator a volcanic belt has been created. The oldest of these volcanic belts in existence is the one which is to "explode," dropping a goodly portion of the earth under the sea.

"This belt," Dr. Nobles explains, "extends roughly from Iceland through the northern part of North America (up near the Pole), through Alaska to the northeastern part of Siberia, thence down the fringe of islands on the east coast of Asia, through the Malay Archipelago, India, Persia, Northern Africa, Italy, Germany, Sweden, Denmark, and back to Iceland."

Noting Signs Leading to Upheavals

Not only is this broad area affected by volcanic activity, he believes, but the whole section is a vast honeycomb underground.

"When Vesuvius erupts," he declares, "Hecla, 2,800 miles away snows lava. And when Hecla or Vesuvius are active, water in the lake of the old crater of Mount Wan in Southwest Asia sinks to a lower level.

"The whole system is linked together in such a way

Where the Lantern Signal Shone

Christ Church, Boston, Remains a Beacon Light in American History

By MAY B. WHITING

WHEN the bells of Christ Church ring out it is as if a miracle occurred in Boston's North End. In one of Poe's stories wild masqueraders pause at the stroke of a clock to think, so when the old bells, still among the two or three loveliest peals in the country, send their serene notes over Copp's Hill, the jarring noises of a foreign quarter are hushed, and even the odors seem less pungent. In the eyes of the few faithful threading their way to service, the squalor vanishes, and the North End is once more an island, with canal connecting the Mill Pond and Charles River, a pleasant place of homes and mansions of the gentry, with gardens extending back to Sun Court and Moon street.

An earthquake might as well have struck New England, writes Mr. Quincy, when Dr. Timothy Cutler, graduate of Harvard and President of Yale, renounced the Puritan faith and returned to the Church of England. About forty years before, Governor Randolph had introduced services in the east room of the Town House, and, then, by very questionable means, had appropriated the Old South Church.

In 1688 King's Chapel was built, and soon after subscriptions were invited "for a church in the North End of the Town." The Earl of Thanet, Peter Faneuil, and Henry Franklyn were among the donors, and work was at once begun. The church was built after the lines of Christopher Wren, solidly, to withstand the shocks of time, with walls two and a half feet thick and those of the belfry three and a half. Except for the first State House, it is the oldest public building in Boston today.

In April, 1723, it was open for services. "Their first meeting at Mr. Cutler's new church, a great appearance, said to be." It was some time before the interior and the furnishings were complete, for, like other churches, they had to wait for funds. An order was soon passed to "put no nails or pinns in the pillars in front of the Gallerys with the intent to hang hats on." Three years after its opening twenty shillings was voted to Mr. Tickle, the sexton, "as an encouragement for former services due," and Mr. Oxman was to have sixteen shillings for "taking care of ye negroes and white boys during divine service."

One of the first expenditures was for an organ, brought from Newport, and when Mr. Cutler's assistant went to London he was requested to bring back an organist, "one that had some trade, if possible, a barber, whom the congregation might improve in his occupation." About twenty years later, in 1759, Thomas Johnson of Brattle street built a new organ for the church, and this case, with the addition of two rows of pipes, is used today.

George II gave some fine gifts to his church in the New World, a large Bible, two folio prayerbooks bound in Turkey leather, twelve other books in calf and gilt, an altarpiece, cushion, and surplices of fine holland. He also gave considerable of the communion silver, now in the Museum of Fine Arts, beautiful flagons, chalices, and a receiver for alms.

It must have been a picturesque congregation in those days, the governor and his lady, sea captains, and wealthy merchants of the North End, without a touch of Puritan grayness, but for contrast the "32 Negroe and Indian slaves" that Dr. Cutler writes about. Doubtless it was a gay sight at Christmas when the church was decorated with greens and candles, and a warder standing at the door asking alms. We may guess that more than one Puritan youth strolled up Salem street for a glimpse of the forbidden "popery."

The North End was always a favorite residence for those who followed the sea, for they liked to watch the ships riding at anchor. In 1727, the Bay Pew, "handsomely lin'd with chany," was set aside for the Gentlemen of the Bay of Honduras, and a collation was also served these same gentlemen in recognition of a generous gift of logwood.

Some of the ornaments of the church were acquired in rather a peculiar manner. During the French war Captain Gruchy, commander of the privateer, *Queen of Hungary*, gave four statuettes of carved wood, in excellent artistic design, which were intended for a church of another faith somewhere along the Saint Lawrence River. In similar manner came the glass chandeliers, or "branches," as they were called.

Just where the belfry clock came from is not clear. In 1735 there is mention of "Sundry old parts of a clock in a case," the gift of Captain Southwack. Cyprian Southwack was a maker of charts and received "a gould chaine and medall" as a mark of royal favor. His boat was the *Province Galley*, and when he gave the clock there was no belfry in which to put it.

Five years later, the Gentlemen of the Bay gave twenty tons of logwood to build a steeple. Captain William Fletcher offered to transport it, and, for his kindness, a cask of brandy was put at his disposal. By 1750 the belfry was done, the clock in its place, and the selectmen agreed to keep it in repair. Of still earlier date is the clock on the gallery, which for nearly two hundred years has marked the fortunes of the church. In 1725 it was built by Richard Avery, and Thomas Bennett made the case.

Not long after the completion of the belfry, Captain Clark of Barbadoes suggested a peal of bells, and in 1744 they were brought from England. These bells are among our most valuable relics of the past, with a beauty of tone that not half a dozen peals in the country can rival. They are chimed by one person by means of cords attached to their clappers, but when they were first put in place there was a guild of eight bell ringers, among whom was Paul Revere. Thirty years ago cords were again attached to their wheels so that they might be pealed, bringing out the richness of their blended notes,

The Old North Church, Boston.

but so little attention has been paid to the art of bell ringing in this country that it was impossible to find eight bell ringers, although on July 4, 1896, six of the bells were pealed.

Each bell has a quaint inscription around the crown:

No. 1. "This peal of eight bells is the gift of a number of generous persons to Christ Church in Boston, New England. Anno 1744."

No. 2. "This church was founded in the year 1723, Timothy Cutler, Doctor in Divinity, the First Rector."

No. 3. "We are the first ring of bells cast for the British Empire in North America."

No. 4. "God preserve the Church of England."

No. 5. "William Shirley, Esqr., Governour of Massachusetts Bay in N. England."

No. 6. "The subscriptions for these bells was begun by John Hammock and Robert Temple, Church Wardens, 1743, & compleated by Robt Jenkins and Jno. Gould, Church Wardens. Anno 1744."

No. 7. "Since generosity has opened our mouths our tongues shall ring aloud its praise."

No. 8. "Abel Rudhall of Gloucester cast us all. Anno 1744."

As the years passed the church took its place in the activities of the town. Dr. Cutler possessed a spirit of wisdom and reconciliation, and was able to counsel wisely when such misunderstandings occurred as Governor Belcher's appointing a fast on a feast day of the church.

But changes come and the Colonial period was drawing to a close. Dr. Cutler passed on in 1765 and Dr. Mather Biles, son of the minister of Hollis Street Church, took his place. A diarist of the time writes, "Mr. Biles' little flock is more for liberty than any Epi=co. congregation north of Maryland." But Mr. Biles did not share the political views of the larger part of his congregation and he was banished by the act of 1778 "to suffer death without benefit of clergy" if he should return.

With this event and the withdrawal of aid from the Venerable Society for Propagating the Gospel, services were suspended and the building closed for three years. Yet in this time occurred the events which bind it most closely to the history of the country, although some historians connect them with an older church which stood in North Square and which was pulled down by the British for firewood.

From the steeple of Christ Church General Gage is said to have watched the battle of Bunker Hill, and Major Pitcairn, mortally wounded in that engagement, was interred in a tomb beneath the floor. But the most picturesque event was the hanging of the signal lanterns.

Robert Newman, the sexton, was a well-known man in Boston, the son of a wealthy merchant who had met with reverses. During the occupation of Boston, British officers were quartered in his house and he was obliged to guard his movements with the greatest care.

The day of the eighteenth of April, 1775, considerable movement had been noticed among the British soldiers and it was believed that they were planning an expedition to arrest Hancock and Adams who were visiting in Lexington, and on to Concord to seize the military stores. In haste Dr. Warren sent for Paul Revere, and, with friends, they laid their plans.

That evening Newman sat quietly in his house on the corner of Salem and Shaefe streets waiting for orders, while Captain Pulling was scouting for news. When fairly sure of the British plans, he returned to the North End and got word to Newman who left the house by a window and a sloping roof, taking his keys with him. In silence they went to the church. Newman entered and Pulling locked the door on the outside and departed. The sexton took the lanterns from the closet, climbed to the highest window in the belfry, and there hung them out. Then he retraced his steps, left the church by a rear door, and went home by Unity and North Bennett streets.

Paul Revere has left us a detailed account of that night:

"I agreed with Colonel Conant and some other gentlemen that if the British went by water we would show two lanthrons in the North Church steeple; and if by land, one as a signal, for we were apprehensive it would be difficult to cross the Charles River or get over Boston Neck. I left Dr. Warren, called on a friend, and desired him to make the signals. I then went home, took my boots and surtout, and went to the north part of the town, where I kept a boat; two friends rowed me across Charles River, a little to eastward where the *Somerset*, man-of-war, lay. It was then young flood, the ship was winding, and the moon was rising."

In 1780 Rev. Stephen Lewis, Deputy Chaplain to Bourgoyne's Light Dragoon, took the oath of allegiance, and, under his leadership, the church was reopened. It seems as if his salary was rather uncertain, for we read that it was fixed as "eight silver dollars with a contribution the Sunday after next." By vote of the vestry he was requested to "prepare a proper form of prayer for the Congress of the United States, for the several states, and for their success in the present important contest." Today we see the old prayerbook, the gift of George II, with the prayers for the royal family pasted over by the careful hand of Mr. Stephens.

A few years after its opening the church organized the first Sunday school in the country. A roll of its pupils with their residence still hangs in the vestry, and we read the old names of Methodist Alley, Fish Street, Love Lane, and White Bread Alley.

Those names have passed, as well as the lads in long trousers and maids in pantalets who lived there. Only the old church remains, as firm as when the workmen first laid its foundations.

Once in a while an event occurs to link the present with its past as when, in 1872, the Queen's Grenadier Guards visited Boston and their scarlet coats made brilliant spots of color in the dusky pews as the royal family once more received the prayers of the congregation. The following year was its 150th anniversary, and Dr. William DesBrisay, great-grandson of Mather Biles, preached the sermon.

Time had wrought many changes in the interior of the church, and, in 1913, William Lawrence, Bishop of Massachusetts, undertook its restoration. The slip pews which had been put in to accommodate a larger

Shall Britons Be Radio-Bootleggers?

Owners of Unlicensed Receiving Sets May Be Classed as Criminals

By MAURICE MANNING

Again—America is the land of liberty.

The air is free. In England the air is taxed. You take out a license for your little radio, or you don't "listen-in."

Just now a bill in Parliament proposes a $500 fine, a year in prison, a police search of the British citizen's home for unlicensed receiving sets!

American radio fans should read this article on the slavery endured by free Britons across the sea.

—London, March, 1925.

THE English are a tolerant and long-suffering race and it seemed recently as if they had been lulled into a sense of security regarding the Jewish Peril. Even the editor of a great morning newspaper, which a few years ago distinguished itself by publishing a bold series of articles on the subject, expressed the opinion in a recent conversation that the "Chosen People" were not nearly so powerful nor so menacing in England as they are in the United States. He instanced the fact that the great joint-stock banks are controlled by Christians—in many cases by members of the old county families and by merchants and big manufacturers who form the backbone of the nation. None of the really influential and wealthy newspapers in London or in the Provinces, he also pointed out, have as yet fallen under Jewish control.

But there has been a sudden awakening. Tempted by an apparently somnolent Gentile indifference, English Jews seem to have lost their heads and gone too far. The postmaster-general in Mr. Baldwin's government has introduced a bill, not only making it a crime punishable by a fine of £100 or a year's imprisonment or both for any one to have an unlicensed receiving set, but *giving the police power to search homes and other premises without a warrant in search of evidence of this terrible crime!*

And now John Bull is roaring from one end of the land to the other, "An Englishman's house is his castle!" The attempt to invade that castle strikes at one of the tenderest of the Briton's heart-chords. For several years the British Lion has been lying down like a little lamb (and as Americans would never lie down) to the barefaced imposture of mulcting every listener-in ten shillings ($2.50) a year for the privilege of listening in the privacy of his own home to the select patter sent out by the British Broadcasting Company. It has been cleverly managed up to this time. The British Broadcasting Company programs on Sunday evenings have usually included a short sermon by a well-known preacher. Sometimes, there has been a hymn or choral music. That captured the religious and imparted a tone of sanctity to the business. For the patriotic, every possible occasion has been used to broadcast remarks of the King or the Prince of Wales at the opening of an exhibition or a corner stone laying. The family circle has been cultivated by means of the story-telling hour. People have been made to feel that the British Broadcasting Company is really a most benevolent institution, giving them such a lot in the way of orchestras and brass bands and songs for their little ten shillings!

Paying Tribute But Not to Caesar

And the demand for apparatus has increased by leaps and bounds. Listeners-in who a year or so ago would have considered a valve set at $20 to $30 riotously extravagant are now buying sets costing from $100 to $500 and thinking nothing of it. And as practically every instrument and every bit of material for homemade sets pays tribute to the Marconi Company, of which the British Broadcasting Company itself is only a subordinate corporation, the profits from this source alone must be enormous.

Imagine, for a moment, every user of the gramophone, after paying for his instrument and records, being obliged in addition to render a further tribute annually in the shape of license fees! Very cleverly in an epoch in which it is recognized that every possible resource must be tapped to produce government revenue sufficient to balance the national budget, this tax is disguised as a light levy on luxury. The Isaacs family, who control the Marconi Company, just furnishes the fun and uses the Post Office Department as its collector and so lets the onus of the exaction fall on the government. But three shillings out of every ten collected falls into the Isaacs' coffers.

This time, however, greed has overreached itself and we should not be surprised if the introduction of this bill may not result in a demand for the abolition of the license fee for using the air. It may have even more far-reaching consequences in a political way. In the House of Commons, decided opposition has already manifested itself. The Socialist M. P. for Dundee, Thomas Johnston, has given notice of a motion for the rejection of the Wireless Telegraphy Amendment Bill, as it is called. A motion to refuse a second reading has also been put down by the Liberal M. P. for Bethnal Green. This latter amendment declares that the bill "gives immense powers to a government department, inflicts excessive fines for infringement of the regulations made under such powers, creates new rights of search which unduly infringe the personal liberties of the subject, while at the same time discouraging scientific research and experiments in the new industry."

The Dungeon for Small Boy With Crystal Set

In a memorandum on the subject issued by the Freedom Association, it is declared, "Governments have fallen in England for a much smaller offense than the introduction of such a measure as this empowering the police without warrant or process of law to enter a house and institute domiciliary search, fining heavily or sending to jail a householder whose small boy shall be discovered to be using a crystal set he has made, either for pleasure or for scientific experiment."

The Radio-Association, at a recent meeting, characterized the bill as far too stringent and "bordering on the ridiculous." The Association very conservatively proposes that the penalties fixed in the bill should be reduced to a maximum fine of £20 with no alternative of imprisonment and that powers of house search should be omitted from it.

Scientists generally are laughing at the legal absurdities of the measure. Referring to the clause which makes the provisions of the act apply to "the installation and working of apparatus for utilizing etheric waves for the purpose of sending or receiving of energy without the aid of any wire connecting the points from and at which the energy is sent and received as they apply to the installation of wireless telegraphy," a London university professor says the drafters of the bill have made a funny mistake in the use of the term "etheric waves." They seem to be unaware that these etheric waves come into operation in many of the everyday things which we do, and which may legally come under the definition of wireless telegraphy. As Campbell Swinton, a noted engineer, points out, anyone who provides and lights a candle may be infringing such an act. The use of any form of radiant heat and light may be an offense. A person using spectacles or eyeglasses, which are obviously "apparatus for the utilization of etheric waves," may be an offender.

The great danger of the bill lies in the restriction it places on honest scientific experiment. The Post Office proposes to interfere with any method already known or which may be invented in the future for utilizing etheric waves in the sending or receiving of energy. It only needs a development of telepathy, therefore, for the Isaacs family to insist on monopolizing that too. Indeed, they may go so far as to demand tribute on every thought interchanged by any method!

About the Man in the Wireless Mask

All sections of the press not notoriously under Jewish domination are going for the proposed law and heaping satire and ridicule on it, both in editorial columns and cartoons. Even so dignified a Conservative sheet as the *Evening Standard* discusses the bill in this fashion:

> "Undoubtedly the immense extension of wireless has rendered necessary some increase in the powers of control which were considered adequate over twenty years ago. But the powers which are now sought and the penalties which are now claimed as necessary to the proper vindication of authority seem quite unnecessarily stringent. The wireless 'pirate'—the person who evades payment of the ten-shilling license—might, one would imagine, be regarded as belonging to much the same category as the people who neglect to take out licenses for dogs or armorial bearings, but . . . . a defaulting dog-owner is not liable, on conviction, to imprisonment, with or without hard labor, for twelve months, or to a fine of £100. The police do not enter houses and rake over the plate-basket in order to find out whether some mustard-pot bears a crest. . . . There is nothing in the bill, apparently, to prevent the police, or any officer appointed by the Postmaster-General, the Admiralty, the Army Council or the Board of Trade, from intruding at any time they like on the house of any citizen, on the off-chance that he, or his son or his daughter, or his manservant or his maidservant may be maintaining some rudimentary form of wireless apparatus without having paid due tribute to the Government and the British Broadcasting Company."

On the surface, it might seem that what the Messrs. Isaacs in the mask of the British Broadcasting Company are most concerned about is in getting all that is coming to them in the matter of these license fees—for that the postmaster-general's bill is plainly inspired by this private profit-making company must be obvious. That in itself would be a very tidy item, for the postmaster-general estimates that there are about two million listening-in sets in operation in England today which have not paid a license. As to the number paying licenses, I have not the exact figures by me, but they may be approximated from the fact that R. M. Ford, of London, who a week ago publicly invited the postmaster-general to prosecute him for possessing an unlicensed crystal set, has now gone a step further and carried the matter up to the High Court of Justice where he has applied for an injunction to restrain the postmaster-general from paying over to the British Broadcasting Company the sum of £38,000 ($190,000) for its share of licenses and renewals *collected during the month of February*. In this application, Mr. Ford raises the whole question of the legality both of a charge by a private company for the use of the air by listeners-in or experimenters, and of its using a government department to collect its tribute. The postmaster-general asked and was granted a postponement of the hearing for a fortnight, evidently taken by surprise.

Under the live lead of Lord Beaverbrook, owner of the *Daily Express* and the *Evening Standard*, a movement is now under way to organize listeners-in the country over into a "Wireless League." The primary purpose of the League will be to break up the present monopoly of broadcasting and to emancipate the public from being entirely at the mercy of that monopoly in its choice of programs. The idea is to be well prepared beforehand for the fair public consideration of the issues which will arise when the question of renewing the British Broadcasting Company's contract comes up next year.

Ostensibly the legitimate interest of the manufacturers in asking for a monopoly was chiefly to stimulate the demand for wireless sets. But the need for such stimulation (a sort of protective tariff) by daily programs no longer exists. Listening-in has grown from an experimental novelty into a powerful and permanent feature of modern life.

A Rich Harvest After Broadcasting

As to the tax upon the people imposed by the present license system, it is to be remembered that every instrument put into use, whether it be a two-dollar crystal set or a thousand-dollar high-power valve set, pays ten shillings yearly ($2.50) to the Post Office Department and that the Post Office pays over to the British Broadcasting Company 75 per cent of these license fees. Under this clause, more than £850,000 ($4,250,000) has passed into the coffers of the British Broadcasting Company. This means that in addition to the Post Office's 25 per cent share of license fees, British listeners-in have paid this large amount for programs in the selection of which they have no voice.

According to government replies to questions in the House of Commons recently, the number of receiving licenses so far issued and in force is 1,311,000 and the number of experimental licenses for sending out wireless was 2,200 at the end of February. To get the government's amended wireless act through, a sop may be thrown to the public in the shape of a reduction of the license fee applicable to both crystal and valve sets.

As alternatives to the British Broadcasting Company monopoly various suggestions are being made. (1) The throwing open of broadcasting to unrestricted competition and the abolition of license fees. (2) The taking over of the British Broadcasting Company monopoly by the Post Office Department as it now administers the government monopoly of telegraph and telephone services. (3) The taking over of it by the listeners-in themselves organized into a co-operative association. (4) The formation of a mixed board in which both the listeners-in and the manufacturers would be represented.

A prominent Conservative M.P., Sir Park Goff, arguing in favor of throwing the business of broadcasting open to competition, calls attention to the fact that as against London's one poor lonely broadcasting station New York has 16, Chicago 8 and even Paris, where broadcasting is not yet popular, has 4.

Only a few months ago, Godfrey Isaacs resigned the chairmanship of the Marconi Company on account of "illness" and *a former postmaster-general was chosen as his successor. The relations between the Marconi corporation and the Post Office Department have, almost from the first, been of a peculiarly close and friendly nature.* Just before the war one postmaster-general made contracts involving millions of pounds for the erection of wireless stations at points practically girdling the British Empire. It was in some respects a fantastic agreement, with all the advantages on the side of the company and all the risks and disadvantages on the side of the government. The successor of this particular postmaster-general, when the war was going on and the execution of the contracts became obviously impossible, simply canceled them. But Godfrey Isaacs would take no cancellation and carried the case into court. There was a hard-fought legal battle, but the contract—probably drawn by instructions of Godfrey's brother, Rufus Isaacs, once Attorney-General, and later Lord Chief Justice and Ambassador to Washington, and lastly Viceroy of India as Earl of Reading—held tight and the Government Law Officer has to advise a "settlement" at a good round sum. The rough forthright postmaster-general who proved such a thorn in the flesh of the Isaacs brothers soon after left office and sank without a sign.

Returning to the Days of "Dora"

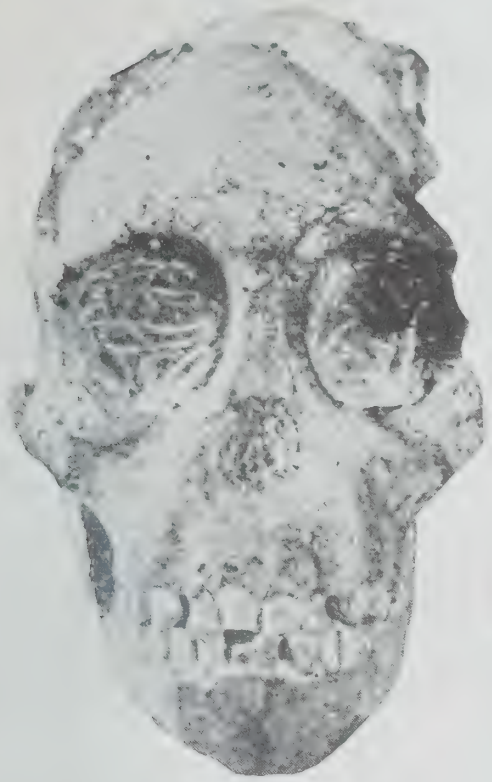
Americans perhaps need to be reminded that in England the Post Office Department controls and administers the national telegraph and telephone systems and has extensive factories for the manufacture and supply of electrical equipment. Among its thousands of officials and employes, naturally enough, there are many interested in electrical research and experiment. One or the other of these is likely at any hour to make some important discovery in regard to wireless telegraphy. Under the bill now before Parliament, the Marconi interests—using the long arm of the Post Office—would be able to keep close watch on all this experimenting and to pounce on any improvement that might be made. Moreover, aside from workers in the nation's telegraph and telephone systems, the measure menaces the freedom of every scientific investigator and inventor, for should it become law, he will be unable to carry out experiments without revealing to officials the ideas on which he is working. He would have no recourse, for the bill gives the postmaster-general power to settle at his discretion any points which may arise without reference to Parliament—a reminder of that mischievous war-time measure, the Defense of the Realm Act, unpopularly known as "Dora," which shackled the liberty of the individual at every turn, to meet a great national danger and exigency, but which was repealed long ago.

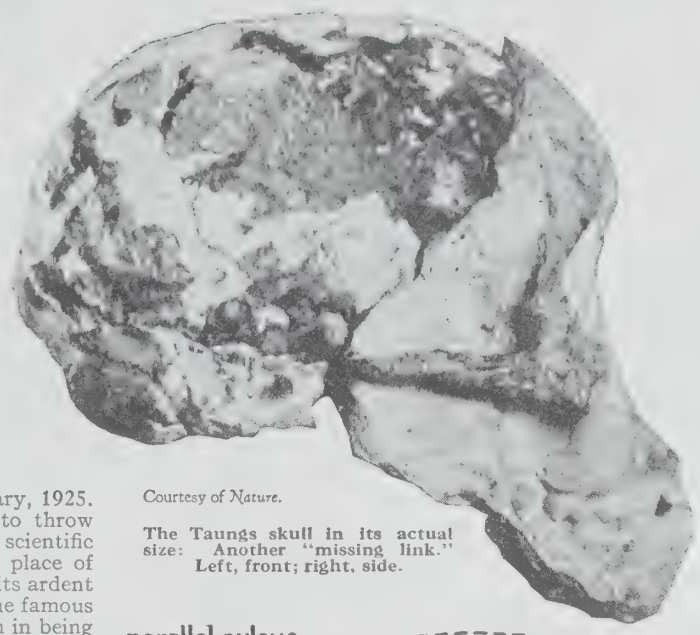
Was This the Birthplace of Mankind?

Discovery of Skull of Manlike Ape Suggests That It May Have Been in Bechuanaland, South Africa

By ALBERT ERNEST JENKS

Professor of Anthropology, University of Minnesota.





Courtesy of *Nature*.

The Taungs skull in its actual size: Another "missing link." Left, front; right, side.

—London, February, 1925.

AFRICA, the "dark continent," bids fair to throw a great light on one of the most important scientific questions before the world—namely, the place of man's origin. Southeastern Asia has long had its ardent backers as the "cradle of the human race." The famous Asiatic expeditions of Andrews have great faith in being able to show that Northern Asia, in the area of the present deserts of Mongolia, was the site where not only gigantic vertebrate animals originated but man himself. Western Europe with its prehistoric types of men, such as the Piltdown man of Sussex, England, and the score of specimens found of Neanderthal men, mainly on the Continent, has been the prime favorite for the past generation. Now, however, the continent of Africa steps forward with most suggestive claims, compelling attention.

By wireless our steamer got the news Friday, February 6, that a fossil skull "which represents something midway between a man's and a great ape's" had just been reported from Capetown as having been found at Taungs, Bechuanaland, South Africa. Consequently, we were eager for the facts on landing at Southampton the afternoon of Saturday, but could learn nothing more until Sunday in London when *The Times* had a short article by Sir Arthur H. Keith who had been furnished a copy of the manuscript of Dr. Raymond Dart who had brought the remarkable find to light. *Nature* of February 7 had published Dr. Dart's manuscript in full, but it was impossible to buy a copy at any of the dozen bookstalls Sunday when I sought for that scientific periodical.

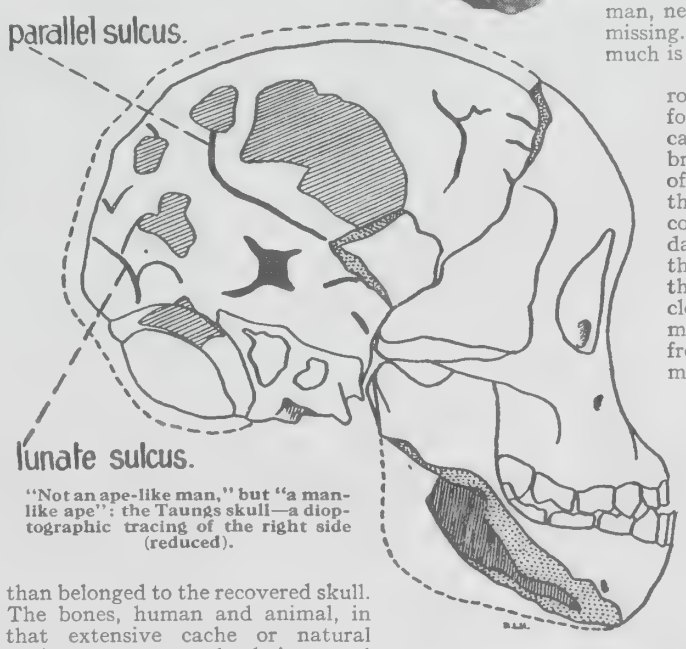
Fortunately I had requested a conference with Sir Arthur H. Keith, anatomist of the Royal College of Surgeons in London, and the greatest British physical anthropologist, before leaving America. I saw him Monday morning, February 9.

According to the very capable anatomist, Dr. Raymond Dart, of Johannesburg, and Dr. Keith, the newly discovered fossil represents a super-anthropoid ape—in other words, an ape superior to the existing apes of the world, including the gorilla and chimpanzee of Africa. About these two and their startling intelligence much has recently been written. "John Daniel," the clever gorilla who died last year in America of a broken heart, due to separation from his teacher and beloved friend, Miss Cunningham, we all remember; while vaudeville-performing chimpanzees are known to all school children.

This new fossil ape, that Dr. Dart tentatively names "*Australopithecus Africanus*" (or "southern ape of Africa"), possessed, it would seem, an intelligence greater and more human than even the educated John Daniel. And though the "Missing Link" is still missing as far as Africa is concerned, yet there can be no question that the broken space in the chain has been greatly shortened by the two epoch-making fossils coming to light in South Africa in the last four years.

From the lime-impregnated "Broken Hill" mine in Northern Rhodesia there was fortunately rescued, quite by accident in 1921, that most ape-like human fossil so far known from Africa, the "*Homo rhodesiensis*"; now late in 1924 that most manlike ape so far discovered anywhere, *Australopithecus Africanus*, was rescued but more deliberately from a lime cliff at Taungs and not more than 600 miles in a southeasterly direction from the site of the other find. Geographically the broken space in the chain is much shortened. Biologically also, according to the two anatomists most capable of speaking, the broken space in the chain is shortened greatly.

Homo rhodesiensis, whose front and left profile are reproduced herewith in extremely clear photographs, was found in 1921 among many fossil bones of animals at a level of 90 feet below the surrounding plain. A small conical hill with an open fissure from near the top to the bottom and with a tunnel-like horizontal grotto meeting this fissure at right angle on the ground level, was being mined away by the Rhodesia Broken Hill Development Company, Ltd., when a workman found the remarkable human skull. Near at hand were also recovered, after the skull was handed over to the manager, a complete tibia or shin bone, a sacrum or lower part of the spinal column, the two ends of a broken femur or thigh bone, and part of a lower jaw—but a slighter jaw than belonged to the recovered skull. The bones, human and animal, in that extensive cache or natural pocket, were so completely incrusted with silicate of zinc that they were being "mined" and went into the smelter. However, broken animal bones which had been used for food by man and crude implements of stone and bone were recovered in small quantity after the skull was found. What priceless human records have been destroyed in the mining operations no one will ever know. But "spilt milk" is already spilled, and the world is thankful for those parts of the Rhodesian man rescued and given to science.



"Not an ape-like man," but "a man-like ape": the Taungs skull—a diop-tographic tracing of the right side (reduced).

The originals are now in the British Museum in South Kensington, London. I there measured the skull February 10. At once it will be noted that the face is massive with practically no forehead. In fact, in this regard it is the most ape-like of all human skulls now known. Also it is the most ape-like in its massive face. The face is also broader than it is high as measured in the height shown best in the profile view. One notices at once also the large sockets for the eyes, which, as great caverns, glare from beneath their ape-like excessive brow-ridges. In no other skull are the ridges so pitted over their entire front surface—pitted for the attachment of strong muscles. The nasal opening is characteristic of only tropical man and apes today, being extremely broad—though the nasal bones (seen in profile) proclaim a rather prominent nose for the living possessor.

The depth of the bones below the nasal opening is also great and approaches that of the gorilla—rather than the modern man. The lower jaw, not found, was undoubtedly practically chinless—as in the other early varieties of mankind and the apes. The brain-cavity in the skull is probably somewhat less than 1,300 cubic centimeters, but is clearly human and entirely outside and above the possible range in volume of any living or fossil ape. The teeth were all present at the time the man died, though one was lost apparently at the time the skull was rescued. They are distinctly human teeth—not ape-like. The palate between the two rows of teeth is also entirely human. The teeth are interesting also in that all except the two central incisors or front teeth, and the left third molar or back tooth have cavities. No other early human teeth show this disease called "caries"—supposed heretofore to have been a modern invention developed largely to torture mankind and make the contemporary dentist necessary and rich as well.

Thus in the most cursory way the skull of the 1921 ape-like man of Africa is brought before us.

The 1924 African fossil ape is distinctly humanoid in characteristics, rather than ape-like. The skull, both in cranium and in face, is harmonious—being long and narrow or dolicocephalic. The eye sockets or orbits are practically round—or humanoid, instead of ape-like. The nasal bones or those forming the bridges of the nose are high up on the face as in man, rather than low down as in the anthropoid apes. The teeth are also more like those of men than those of apes. The lower jaw, much of which also was fortunately recovered, is surprisingly manlike—though there are also ape-like characteristics, as its chinlessness. The skull was also carried more upright above the neck and shoulders, rather than in the forward and drooping position characteristic of the anthropoid apes.

This position of better balance for the head is made certain by the more central placement of the *foramen magnum* or the large opening in the under surface of skulls which marks the spot where the head sits on the spinal column. This better-balanced carriage of the head compels the belief that this new-found African ape walked in a more erect position than do the gorillas and chimpanzees which, though they do not "run on all fours," yet balance themselves while traveling on the ground by steadying their tottering steps by touching the earth now and then with their knuckles. However, in spite of these hitherto undiscovered manlike characteristics of apes, *Australopithecus Africanus* was not a man, neither was he the "Missing Link"—which is still missing. This fact is proved beyond any quibble because much is known about the brain of this new ape.

Most fortunately the hardening of lime into rock, in the extensive lime cliff where the skull was found, had filled about three-fourths of the brain cavity of the skull. This cast of the fossil ape's brain was recovered—in fact, it was the binding of the brain cast which first called attention to the probability that bone fragments of the skull could perhaps be rescued. Dr. Keith presents data showing from the brain cast of this new fossil that its possessor was an ape and not a man. For the sake of better placing this fossil more or less closely in its proper place between living apes and modern man, I reproduce below some of his figures from *The Times*, London, February 7, 1925. It must, of course, be borne in mind that, whereas there is no evidence that with normal men larger brains mean greater intelligence than smaller brains, it is nevertheless true that there is an average (or better, a mean) size for the human brain, and there is also a lower limit to the size of the normal human brain. The largest brain of any living ape is far smaller than that of any normal man—modern, ancient, primitive, fossil, or what not.

Brain Size in Cubic Centimeters		
Mankind from	950 to	1,900
Mankind, average of modern, about		1,580
Gorillas from	370 to	620
Chimpanzees from	320 to	490

According to Dr. Keith the brain capacity of the new ape, when mature, could not have been greater than that of the mature gorilla. The specimen recovered is of a young and not matured individual. There are also centers in the human brain where the faculty is located which controls speech. The brain cast recovered shows that the ape did not possess articulate speech like mankind, any more than do the living apes. However, it does show that, unlike any of the living apes, it did possess the eye-control for stereoscopic vision quite as in man, and also the much greater use of its hands

(*Concluded on page 14*)

With Our Rulers in Washington

By McKEE BARCLAY

NOW that the Coolidge Administration is getting under way, the politicians of both parties are watching the straws which are to show the direction of the wind for the next four years.

Among other phases of the new régime, the recent rise to power of the Honorable Herbert Hoover is an interesting topic of conversation. Mr. Hoover's primary sphere of influence is, of course, the Department of Commerce, of which he is the head, but he has found other fields of activity and is by way of becoming something of a Pooh Bah. The remark was made in very high quarters the other day that "he puts his spoon in everybody's coffee cup." Several years ago there was some conflict of authority between his department and the Federal Trade Commission. An obliging Congress curtailed the Commission's authority and transferred certain rights of supervision, not to the Department of Commerce, but to the Agricultural Department.

Mr. Hoover next discovered that there was a twilight zone on the borderland between his department and the Agricultural Department. News stories which had all the earmarks of inspired propaganda began to appear.

Newspaper readers learned that Mr. Hoover was going to have a man to his liking at the head of the Agricultural Department or know the reason why. And it was so. A Hoover man who is expected to play Joseph to Mr. Hoover's Pharaoh got the job. When Mr. Coolidge needed a new Secretary of the Navy Mr. Hoover suggested that he appoint his friend and fellow Californian, Curtis D. Wilbur, and the suggestion was adopted. With friends to the right of him and friends to the left of him, Mr. Hoover has achieved an importance at Cabinet meetings which makes some people wonder if it has attracted the President's notice at all.

The Dutch Uncle talk which Mr. Dawes had given the members of the Senate has been kept fresh in the minds of everyone by subsequent events. "It is not," he had said, "for the Vice-President to be personally concerned with the interests of political parties or with the policies or projects involved in legislative action, save in that unusual contingency where, under the Constitution, it becomes necessary for him to cast the deciding vote in case of a tie."

When the tie vote came on Mr. Warren's nomination Mr. Dawes was not there to decide the tie. "I was peacefully snoozing," he ruefully explained. Those who were offended by Mr. Dawes having put his finger on an old Senate sore spot are deriving much comfort as well as amusement from another source. As is well known, the Vice-President is supposed to owe his seat among the mighty to the fact that he walked the floor before a gathering of Congressmen and newspapermen with his hands in his pockets, a cigar in his mouth, a scowl on his brow and cuss-words streaming from his mouth. The he-man reputation gained by this Hell and Maria incident is being badly hurt just now by the circulation of a typewritten copy of a quotation from Mr. Dawes' *magnum opus,* "A Journal of the Great War," an autobiographical account of the author's important services in France.

"During the war," the quotation reads, "in our inter-allied conferences, whenever I happened to represent our Commander-in-Chief and our army, which was frequently, I soon came to employ certain methods to secure early decision. Where the conference was confronted by the necessity of agreement on something involving a sacrifice to one of the parties and a bitter difference was inevitable, I always endeavored to precipitate immediately the issue in the clearest and most distinct way. By smoking cigars, by great emphasis, by occasional profanity, no matter how dignified the gathering or impressive the surroundings, I generally got everybody in discussion of the very crux of the question in the first half-hour. My disregard of the conventions was studied and with a purpose." Mr. Dawes' vicious attacks on all forms of demagogry during the presidential campaign are being recalled with great gusto by those who read this confession of his habit of staging his hair-on-the-chest plays.

The ruthlessness with which the party steam-roller was used to flatten out the Progressive Senators, though later partially atoned for, is indicative of the real state of mind of the Republican leaders. They feel that in view of the sixteen million votes cast for Mr. Coolidge his administration is on its own and has a mandate to run wild, if it so chooses. A landslide victory is never an unmixed blessing to the party which it places in power. It brings with it temptations to arrogance. The craftiness and sanity that must go with successful political leadership are apt to be relegated to the limbo of unnecessary arts and crafts.

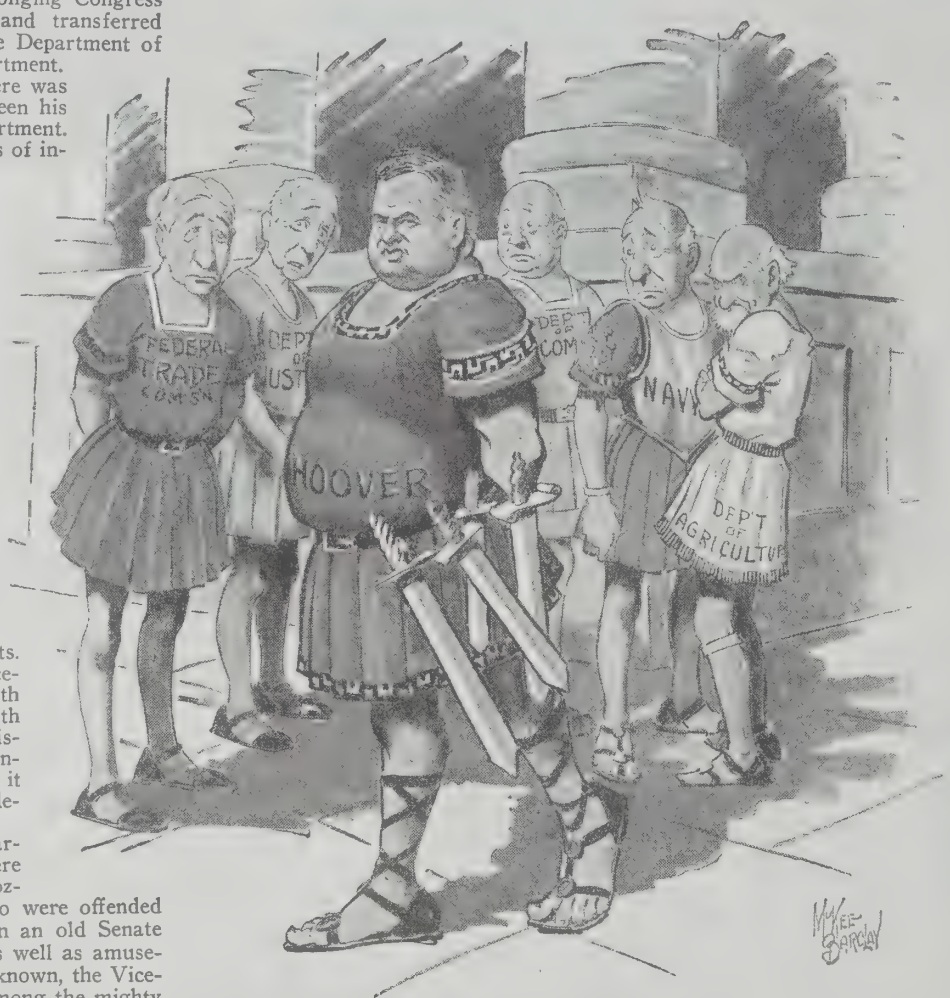
Before the election returns were officially announced word came from the White House that at least two important commissions were to be purged of offending elements. The Tariff Commission and the Federal Trade Commission were named as the targets for executive disciplining. The latter was said to have offended by charging that Mr. Mellon's Aluminum Company of America was a monopoly and was using unfair trade practices. The commission was accused of attempting to influence the election in favor of the Democrats by the exposé. Later, to the surprise of its friends and its foes, the new Attorney-General, Mr. Stone, indorsed its action. Word had been passed around that a way would be found to rid the Trade Commission of the one western minority member who has for some time past been playing a Horatio-at-the-Bridge rôle. This anti-monopoly member is still at his post but a vacancy which occurred recently gave opportunity for the appointment of a safe pro-monopoly man.

In the case of the Tariff Commission there is a different story to tell. David J. Lewis, a most useful Democratic member, is gone, but in his place the President has put a man who is said to be a sincere low-tariff man, thus maintaining the bipartisan composition of the commission. The menace of the threat seems to have disappeared.

The registering of public sentiment, as evidenced by current comment, seems to prove that President Coolidge's three major policies, Economy, Tax Reduction, and Participation in the World Court seem to have been well received. The big vote of confidence given to him may influence Congress to follow his leadership but if he is to meet the same opposition that was accorded him by the Sixty-Eighth Congress his trio of policies are in grave danger. The forcing out by Congress of the Oil Report which he had pigeonholed since last June is an evidence that the men at the other end of the avenue are not under complete discipline. The facts given in this report by the Federal Trade Commission, the report of the Interior Department showing the record-breaking production of oil and gasoline, the knowledge that the facts secured in the investigation started by the Department of Justice a full year ago have been kept secret—all furnishing topics of interest just at the time when the Tea Pot Dome trial is being featured in the newspapers—lead one to think that the Oil and Gasoline Problem may force itself in as Number Four in Mr. Coolidge's list of policies before his term of office is finished.

Comment on the activities of the minority party must necessarily be of the short-horse-soon-curried type. The Democratic leaders—if there be any worthy of the name—are still floundering in the Slough of Despond into which they walked last summer. Like a scattered covey of frightened quail, they are giving the get-together call. Franklin D. Roosevelt, Al Smith's *alter ego,* has issued a call for a conference of party leaders but the move has been interpreted by the McAdoo men as a ruse to increase the Smith prestige and the deadlock is on again. Most of the Democrats in the House and Senate feel that a watchful waiting policy should be followed. They are hoping that the Republican leaders, drunk with power, will kick the Democratic party upstairs. Just at present the Democratic party is as dead as the Third Party Movement—which, paradoxically speaking, is at an absolute standstill.

The Diet of the Great.



Now, in the name of all the gods at once, upon what meat doth this, our Caesar, feed, that he has grown so great? *Julius Caesar,* Act I, Scene II.

McGuffey's Maxims

Little Tales of Conduct From the Famous School Reader of the Last Generation

THE BIRDS SET FREE

1. A MAN was walking one day through the streets of a city. He saw a boy with a number of small birds for sale, in a cage.

2. He looked with sadness upon the little prisoners, flying about the cage, peeping through the wires, and trying to get out.

3. He stood, for some time, looking at the birds. At last, he said to the boy, "How much do you ask for your birds?"

4. "Fifty cents apiece, sir," said the boy. "I do not mean how much apiece," said the man, "but how much for *all* of them. I want to buy them all."

5. The boy began to count, and found they came to

five dollars. "There is your money," said the man. The boy took it, well pleased with his morning's trade.

6. No sooner was the bargain settled, than the man opened the cage door, and let all the birds fly away.

7. The boy, in great surprise, cried, "What did you do that for, sir? You have lost all your birds."

8. "I will tell you why I did it," said the man. "I was shut up three years in a French prison, as a prisoner of war, and I am resolved never to see any thing in prison which I can make free."

He Is Earthquake Prophet

Concluded from page 2

that when the volcanic force becomes great enough, it will all go. The submersion may be piecemeal at first, as in the case of Japan, but the rest will soon follow."

A short time ago we referred to Dr. Nobles as versed in the secrets of austromancy, or divination by the winds. This statement is slightly inaccurate. Although it is true that he links winds and their direction to earth disturbances, he cannot tell from them what *will* take place. Rather, he says, it is a case of what *is* going on at that time. Numerous erroneous reports have been published to the effect that Dr. Nobles predicts his earthquakes through his study of the winds.

"When volcanic fires are raging beneath the surface of the earth," he declares, "they heat the surrounding crust and cause columns of hot air to rise. A condition resembling a vacuum is thus created, and this causes winds to blow in that direction from distant points.

"Therefore, when I noticed that a wind, which has been blowing toward the south steadily for days, veers suddenly and blows with great intensity toward Iceland, I feel morally certain that something is happening in the great volcano of Hecla there.

"But, it should be kept in mind that the winds blow *after* or *during* the disturbance and not before. Hence, it can hardly be said that they presage the volcanic activity."

Although he is chary of admitting it, the likelihood is that Dr. Nobles predicts his earthquakes through some unknown, unexplained inner sense which we cannot fathom or understand. It is a well-known and admitted fact that persons often have premonitions of danger, of calamities about to happen to themselves or to those close to them.

It may be that in Dr. Nobles' subconscious mind this premonitory instinct has taken a queer twist, due possibly to the intensive study he has made of the earth's surface, so that he foretells disasters to the earth rather than to himself. Surely this would be no more strange than a number of other supposedly inexplicable matters of similar import, and no doubt the Freudians have a glib explanation all ready for just such cases.

It will be interesting to watch the outcome of these prophecies. It may be, as some contend, that Dr. Nobles has no scientific basis for his assumptions and that he is merely extraordinarily lucky in his prophecies.

But it is also well to remember that Noah was derided by his fellows, and that the men of his day once laughed at Newton.

Mr. Ford's Page

ONE of the errors made by publicists is the confusion of public opinion with the public mind. The difference between public opinion and public conviction may be the poles apart. The thick of the world may exist between what is public feeling today and what is the underlying public *belief* yesterday, today and tomorrow.

This has been found true, to their sorrow, by men who have tried to mislead the public by appeals to credulity, superstition or spite. The magician has appealed to credulity, the religious fakir to superstition, the political demagogue to their spite. Yet none of these has been continuously successful, because of the insistence of the inquiring mind of the people. A wave of mind, this way or that, may be started, but no wave of human mind blows continuously in any direction except that of the truth. You may get today's public opinion on your side; can you get tomorrow's public conviction?

Any observer of our American life, enlightened as it is, will see ample illustration of these statements. It is probably less easy than it was a few years ago to rouse public opinion, yet there are signs that the manifold agencies organized to regiment public expression are fairly successful in achieving their ends. It is much easier to get public expression (which is the modern goal) than to get public opinion, which some years ago was the goal sought. That is to say, whereas it was once necessary to engender a public opinion before a public expression could be hoped for, it is now possible to get a public expression without the time and labor necessary to create a public opinion. Any secretary of a pacifist organization can give illustrations of how this works.

In this country we have passed through several grades of opinion on the economic side of things. And to most of us the economic side means business and industry. These are, of course, but appearances, parts, manifestations of economics, but for the casual thinker they stand for the whole thing. It may be worth while to remember that the central economic problem was here before modern industry made its appearance, and that it will remain when modern industry has adapted and purged itself and become an acceptable, proved and wholesome, not to say necessary, part of life.

The entire danger resident in popular resentment against being misled in these matters, to which reference will presently be made, arises from the short-sighted selfishness of men who satisfy themselves that verbal explanations which are accepted by the public are sufficient to satisfy the moral demand for a more adequately social situation.

To put it another way: in this country we have seen a period when the people, ourselves, of course, among them, were roused against business. Business, like a boisterous boy in his first long trousers, was carrying itself quite proudly, with an insufficient regard for some of the finer qualities in which everyone has an interest. And, as the expressed disregard of friends is potent to effect a change upon the schoolboy, and as, in addition, he is also growing more mature and coming to a development of his own mind, so business heeded criticism and, in addition, benefited by a maturity of wisdom in its own quarters.

This enabled business to pass what might have been, and which in a sense undoubtedly was, a crisis. The immaturity of many business methods and the rise of better business men who repudiated the worst of the old methods justified the public mind in reaching a decision that what they regarded as deliberate and organized wickedness was merely a form of business ignorance.

This briefly, and perhaps inadequately, sketches a period in the history of the American mind which makes our people the best educated in industrial and economic questions of any people on the globe. Almost every other people can be classified as having met these same questions; no other people can be classified as having tackled them and dealt with them. Other peoples, perhaps, have charged these questions wildly, poured out their political or revolutionary resentment without stint, but have returned to their normal state with no more knowledge or power than they had when they set out. They have felt the wrongness of the condition; they have achieved only the most crude and altogether impractical ideas of the remedy.

Observers who declare that the American people are socially dull, because they have not during recent years inaugurated the same disorders that have marked other people, overlook the fact that the American economic consciousness is balanced by a high degree of economic knowledge, and that this functions in two directions: first, in preventing the development among us of abuses such as may arise among more backward civilizations and, second, in enabling us to deal more efficiently with such abuses as may creep in and call for our attention. Among competent people you don't need a revolution every time you require to open up a road.

In the last presidential campaign considerable attention was given to the American idea of business. It was not so much a plea from business to be given a chance, as it was a plea from the people themselves that real constructive business be released from the suspicion and hindrance under which it had progressed. The idea was hailed with general agreement. People recognized that industry was so vitally interwoven with our daily welfare that it was no longer an element to be attacked but one to be nurtured. And the recognition, general as it was and phrased in all the terms of common sense and good will, was very pleasant.

The pleasure was due no doubt in part to public satisfaction that as a people we could come to a constructive state of mind concerning industry, but a strong element in the pleasure was the public belief that it was the new era in business that was being proclaimed, not the old errors that were being enthroned again. No man understanding the situation will suggest that this was not part of the public belief, that it was the new, American idea in business that was being given the free highway of American confidence.

Has that hope been fulfilled? Has that confidence been justified? Voices are heard here and there asking these questions. A thought is creeping through the convolutions of the national mind that it is the old style of business, the exploiting and profiteering type, which has stepped in to take the place of what the people thought was promised. And it must be said that this thought has ample justification. There are men who seem to think that the new attitude of the public mind toward business means that the public has laid down its enmity toward the old abuses in business; that the present period means a tranquil truce with evil. Nothing could be more mistaken, as the issue will show.

It is not to warn officials in power that this is written. If they do not see, no mere warning will open their eyes. But it is worth while to say to the people that though their prophetic forecast may seem to be delayed, it really is not. They were right in their expectation, and what they looked for will come to pass. Every bad system must ripen before it rots. If there seems to be, politically, a revival of the old forms of business, it can be but for a brief period. The very times are against it. The old theories will not longer operate. Exploiters are here, just as they always were, but the conditions have changed. Conditions have changed to such an extent that profiteering has come to be the only unprofitable thing. The game itself has turned upon its players.

IN THIS country there has been a period when people were aroused against business, so business heeded criticism and benefited by a maturity of wisdom within itself. This convinced the public mind that what they had regarded as organized wickedness was merely a form of business ignorance. The American mind recognized that industry is so vitally interwoven with our daily welfare that it is no longer an element to be attacked. But a thought is now creeping through the public mind that it is the old style of business, the exploiting and profiteering type, which has stepped in to take the place of what was promised. But if there seems to be politically a revival of the old forms of business, conditions have changed so much that profiteering has come to be the only unprofitable thing.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

1. Notify us at least two weeks in advance.
2. Give both old and new address.
3. Write clearly.

Who Says "Conference"?

THERE has been no loud call, nor even a modest call, from the people of the United States for another disarmament conference, or reduction of armament conference, or armament conference, or whatever the wordsmiths may decide to name it, and yet announcements seem to indicate that such a conference will be held. Of course, any time the President of the United States calls a meeting, it will be attended; but the purpose of calling a meeting, at least in the American sense, is to get something done. And there is no prospect of getting anything done by meetings in the immediate future. Was the Harding Conference such a very good thing for the strong and peaceable nations of the world, that it can afford to be repeated? Or are these conferences becoming a sort of fixed ritual, like the inauguration parade?

These are questions, and they do not indicate hostility to the proposal; they do, however, represent a state of mind on the part of the American people. Who wants the conference? Who is it that keeps urging the President to call a conference? Why is it that nowhere in the United States can you hear "conference," except out of occasional Washington dispatches? One wonders if sometimes the continuous buzz of paid pacifist organizations in Washington rises to so loud and insistent a sound that the President mistakes it for the voice of the people? That is the peril of residing in Washington. It is so easy to mistake the propagandist for the people. One press agency removes its men from the Capital city at frequent intervals to prevent their being poison-gassed and succumbing to the Washington point of view. It might even be a good thing for Presidents to live among the people and go to Washington only as the priest enters the holy of holies, to perform his office, bringing the mind of the people with him.

It will not be gainsaid that "conference" is not a national suggestion at this time and is not felt to be a national need. Nor is it felt to promise any benefit internationally. If the President really intends to call such a meeting, it would be the part of prudence to take his own people into his confidence as to his reasons, so that when the visiting foreigners arrive they might feel themselves to be the guests of the people of the United States as well as of the official coterie at Washington. The people having already voted and done their part, this inclusion of them into further confidence might not be deemed necessary. It would, however, be advisable.

A Vision of the Future

THE loss, through revolution, of position, power, and estate has the effect of making many noblemen mad. They go to foreign capitals, borrow money, dissipate, shout prophecies to the press, see in every politician's sympathy the prelude of a successful counter-revolution, in every adventurer the hero of an immediate restoration of the good old days. And so, babbling, they die.

Others become philosophical like Plato and Heraclitus of Ephesus, but the crowd swept them and their aristocratic brethren aside.

Like these Greeks of old, a nobleman of our day, Count Hermann von Keyserling, was dispossessed by a revolutionary mob; and like them he has taken to philosophizing. The *Living Age* tells us that, his estates in Russia having been confiscated, he moved to Germany, and there at present is conducting a school of philosophy resembling those which flourished in ancient Greece.

Speaking of Europe today, he says:

> "Every government is burdened with such heavy obligations that even under the most favorable circumstances it can barely meet them .... On the other hand, economic Europe, if left to itself, can easily recover. A great modern business organization, especially if it rests on a supernational basis, is already a Great Power, against which no political government of today can measure itself on equal terms."

The first phase of the movement will end, the Count concludes, with the creation of an economically cohesive United States of Europe. And ultimately, he sees the great supernational industries stretching economic nets over the entire world, making countries economically interdependent; while racial and national differences will tend to become more accentuated, wars more difficult to start, cultures more proudly contrasting than ever before. Eternal conflict on cultural and intellectual grounds, but on those more material, industry and peace.

Whether or not the Count's vision of the future will be realized, his grasp of the trends of the present day seems admirably firm. It is a pity that the world's very political politicians cannot find time to visit his school, one thinks, that they might for a few minutes come into contact with his fundamental and practical imagination, and return less eager to erect antiquated castles of political cards in a world that craves sound theory, applicable truth.

Not Trash, But the Classics

IN BOSTON recently Mrs. Fiske with an all-star cast played Sheridan's "The Rivals." There has been no such acting of the great comedy, one of the two or three greatest in the English language, since Joseph Jefferson, Julia Marlowe and Mrs. Drew, the mother of John, Lionel and Ethel Barrymore, played it in 1896. At the end of the second act (in Boston) there were *thirty-four* curtain calls, and finally the entire audience stood, thrilled by the great acting, and by the realization that on this very night, 150 years ago, in London at Covent Garden Theater, this play was first played, the work of an Irish boy 23 years old, now long since buried in Westminster Abbey. Apparently "being dead he yet liveth."

We are better than the critics of the race are wont to think. The readers of the Chicago *Tribune*, when that paper asked them—expecting them to cry "yes, yes" with eager avidity—"Shall we broadcast to you by radio the Leopold-Loeb trial completely as it proceeds?" voted an emphatic NO. This year all the plays that have been sent out on tour from New York have been financial failures except two, and they are not the trash but the classics: Rostand's "Cyrano de Bergerac," with Walter Hampden playing Cyrano, and Sheridan's "The Rivals," which broke the box office receipts records of thirty years in Philadelphia.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912,

Of THE DEARBORN INDEPENDENT, the Ford International Weekly, published weekly at Dearborn, Michigan, for April 1, 1925, State of Michigan, County of Wayne, ss.

Before me, a Notary Public in and for the State and County aforesaid, personally appeared Fred L. Black, who, having been duly sworn according to law, deposes and says that he is the Business Manager of THE DEARBORN INDEPENDENT, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in Section 443, Postal Laws and Regulations, to wit:

1. That the names and addresses of the publisher, editor, managing editor and business managers are:

Publisher, The Dearborn Publishing Company, Dearborn, Michigan; Editor, W. J. Cameron, Dearborn, Michigan; Managing Editor, none; Business Manager, Fred L. Black, Dearborn, Michigan.

2. That the owners holding one per cent or more of the stock are:

The Ford Motor Company of Delaware; Henry Ford, Dearborn, Michigan; E. G. Liebold, Detroit, Michigan; Clifford B. Longley, Royal Oak, Michigan.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: none.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders, who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

FRED L. BLACK,
Business Manager.

Sworn to and subscribed before me this 6th day of April, 1925.

[SEAL]

J. EMMET HALL,
(My Commission expires September 21, 1928.)

Cinemania

A LIST of motion pictures slated for production, or recently released, made public on March 29, shows conclusively that no country's producers can compete with ours in the exudation of sensational celluloid.

"Idle Tongues," "Learning to Love," "Playing With Souls," "Enticement," "The City That Never Sleeps," "The Garden of Weeds," "Tongues of Flame," "Locked Doors," "Too Many Kisses," "Cheap Kisses," "Tainted Souls," "Flashing Spurs," "Parisian Nights," "The Sporting Venus," "A Cafe in Cairo," "Dangerous Pleasure," "The Robes of Sin"—these are a few choice selections from a list of about three hundred items. And rather more than less.

Three hundred items, eighty per cent of which are at best obvious cheapjack. Two hundred and forty animated demonstrations at length of the bankrupt imagination in all its gaudy, toothless glory. Billed to be, or in the process of being, broadcast in thousands of cinema transmitting stations throughout the world.

Marked even to their titles with the emaciation of the minds that conceived them—if such labels as "Flashing Spurs," "Galloping Vengeance," "Thundering Hoofs," "Cheap Kisses," and "Too Many Kisses," don't point to a mere mechanical mortising of violent words, to what do they point?—these films go forth further to stultify millions already stunned by the perpetual impact of the headlines and feature sections of a sensational press.

To the producers of this deadening stuff come not only monetary rewards. In the warmth of its fellow-feeling, the press treats the verbal struttings and considered eccentricities of magnates, directors and actors with the breathless enthusiasm once reserved for the most masterly of master minds. Mere clothes racks, who in an age of taste would be told peremptorily to go back to the laundry or barber shop, receive encomiums which honest and intelligent critics would hesitate to bestow on so many Garricks and Warfields.

Perhaps it would be best if we should solve this problem within our borders by inaugurating a quiet but powerful campaign of non-co-operation. But there's no use of other countries treating it thus. Let them drop at once their speculations as to the best way of dealing with imports from Hollywood and vicinity, and place a prohibitive tariff on all incoming garbage, regardless of the form it takes. That will turn the trick.

Exploring Other Worlds

THAT there are "more things in heaven and earth than is dreamt of in our philosophy" has become a platitude even to millions of human beings to whom this planet is the beginning and end of all things. But the expansive pressure of growth is causing an increased sense of the limitations of this world.

It can be completely encircled by land, circumnavigated by sea or air, within a few weeks. But at mention of air travel a new possibility arises: Will man, as master of the air, be content always to stay within the atmosphere of earth? The field of travel by land or water is limited. Space is boundless. Will airmen sometimes take off and start for other planetary stations in the Solar system? Will an aerial Columbus set sail for new worlds?

A German scientist, Professor Hermann Oberth not only thinks that it is feasible to reach such a comparatively near-at-hand body as the Moon, but thinks that possibly the time is not far off when we shall be making excursions into space and engaging in an exploration of the firmament. Professor Oberth thinks that the problem of reaching the moon is merely the problem of "attaining the neutral zone where the earth's pulling power ceases to exist." He says, however, that first of all a combustible must be discovered capable of projecting an object at such a speed that it will attain this neutral zone, calculated at 225,000 miles distance, for which a velocity of between 4,000 and 5,000 meters a second will be necessary. He says that for the journey into space a steel-cased, hermetically sealed rocket of the dimensions of a Zeppelin would be necessary, fitted with a laboratory and all necessary equipment.

It all sounds rather impossible to us now, but heavier-than-air machines were also "impossible" a little while ago. There's no telling! We may be well within the truth by saying that we of this generation shall never accomplish it, but new generations come, and with them the elements of new and greater adventures.

Are You on the Fake Stock Sucker List?

"Written Guaranties" as a Potent Weapon of the Financial Parasite

This is the third of a series of short articles on the "Fallacies of Finance."

YOU take up your morning's mail. In a plain white, seemingly harmless envelope you discover a circular. It starts out by citing how $100 invested in the Such-and-Such Company (always one of the great industrial enterprises of the country) in a comparatively short time netted the lucky investor $10,000 to $100,000.

It is a never-failing earmark of promotion literature that it tells of a million or so, made by somebody or other, who "got in on the ground floor" of This-or-That Company. Nearly always the instances cited are exaggerated beyond reason, the facts are distorted and the appeal is written with a complete understanding of the cupidity of human nature.

At the bottom of the circular you read of a new industrial venture which is going to make its initial stockholders inordinately wealthy. All you have to do is fill out the accompanying coupon and a block of stock will be reserved for you. If this is your first circular holding out promises of great fortune with the least expenditure of effort and money, take notice; you have been placed upon the Sucker List and your mail henceforth will be heavy and your pocketbook lighter if you listen to the glittering promises held forth.

The writer spent a number of years learning the rudiments of finance and was financial editor of a daily newspaper before he one day awoke to the fact he was on a Sucker List.

It was during the hectic days of the Texas and Oklahoma oil promotions; before the Federal Government took a hand and brought to justice Doctor Frederick Cook, of North Pole fame, and others engaged in the same nefarious business—about 2 per cent of the total promoters busy swindling the public being brought to trial and prosecuted.

One day in my mail I received what purported to be a copy of a petroleum periodical. There were headlines in red and subheads in black and the "news matter" below told of the many mergers which were going on in the oil industry. Hundreds of companies were being consolidated. If you held stock in a defunct concern all you had to do was send it in with 25 per cent or more in cash and receive stock in a new "live company." These new companies were very much alive—until the Department of Justice operatives took a hand in the game.

I proceeded to make inquiry in this city of slightly more than 100,000 population and discovered that among the business and professional men questioned no less than seventy-nine were receiving literature or oil newspapers from the southern producing fields. The professional men (known among stock swindlers everywhere as easymarks) were in the majority and quite a number had responded to the "Call of the Gusher."

Further investigation revealed that a number of the more progressive promoters had formed their companies in northern states and were just then campaigning the State of Michigan. The State Securities Commission and even some of the shrewdest brokers who desired to protect their clients were taken in and the stock salesman was reveling in the harvest. But in time the oil fiasco was relegated to the dark pages of financial history and the stock swindlers moved north.

It was a short time later that a young woman employed by the newspaper came to me and asked advice regarding an "investment." The stock had been approved by the Michigan State Securities Commission. The commission "guaranteed it," the young lady (we shall call her Miss B) said the stock salesman told her. I was immediately suspicious because the securities commission of any state would refuse to "guarantee" even a government bond.

At the next meeting between Miss B and the salesman (he did not hesitate to approach her in the newspaper office) I contrived to be in close proximity, and I heard the convincing arguments set forth by this son of Wallingford tending to show that she could not help but realize a fortune from a few hundred dollars invested in this concern which was to manufacture paper plates, knives and forks, and many other things.

Miss B. was an able actress. She feigned the reasonable amount of doubt regarding the "investment" until the salesman offered to give her a "WRITTEN GUARANTY." This was an agreement by which he would buy the stock back from her at the price sold within two months if it had not increased 100 per cent in value. Why, according to this, Miss B couldn't lose. If the stock increased in value she sold out and made a profit and if it didn't the salesman was bound to buy her stock back at the price she paid.

This was my first experience with the WRITTEN GUARANTY—a device of the financial parasite calculated to "take in" the unsophisticated nine times out of ten.

An investigation revealed how this new device of the "get-rich-quick" artists was being abused in the City of F———; and throughout the country, if this one city was any indication. This city had been the birthplace of a number of the larger motor corporations. It had a number of citizens who had become independently wealthy through investment in stock companies. It was a paradise for fake stock promoters.

Domestic and foreign stock salesmen began to give WRITTEN GUARANTIES until there was an epidemic of them. A subsequent campaign sent a number of these salesmen to jail but the WRITTEN GUARANTIES were never made good and the public as usual paid the price of its folly.

It was at this time that the writer was offered a proposition by one of the admittedly shrewdest stock swindlers operating in the state. It is with reluctance I look back to having refused the offer, for the opportunity of learning the psychology of the financial parasite at close range may never come again.

But I learned something of this business and the schemes which are used to part the unsophisticated from their money, such as, petering, electing, and the telephone approach.

Values "Secured by Actual Wealth"

By MARCUS T. WOODRUFF

TWO friends recently were discussing the matter of the issue of money. One, an ardent advocate of direct government notes, found it impossible to convince the other that obligations of the government were a better security than the forms of commercial paper by depositing which the Federal Reserve System is permitted to issue its notes, guaranteed by the government.

"Commercial paper has actual wealth behind it," declared the unconvinced man.

"But would the notes issued upon it be acceptable as money if the government did not guarantee it and declare it would maintain it on a parity with gold?" asked the reformer.

"Of course not, but the government is secured for its indorsement."

"True; but what is back of that indorsement?"

"The commercial paper."

"If that were sufficient, why is the indorsement necessary?"

"I can't explain that. All I know is that we have the best money in the world, and I don't want any experiments. You fellows would, if you could, turn every government bond into currency, and then what?"

"Is the government able to owe twenty billion?"

"Of course it is."

"What difference does it make whether it owes it on an interest-bearing bond or a non-interest-bearing note, so far as its ability to owe and pay is concerned?"

"If the entire public debt were in currency, it would depreciate because there would be too much of it."

"How could it, if the government maintained its parity with gold?"

"But the government could not do that."

"And yet you say the government can maintain a bank note at parity with gold to an unlimited amount."

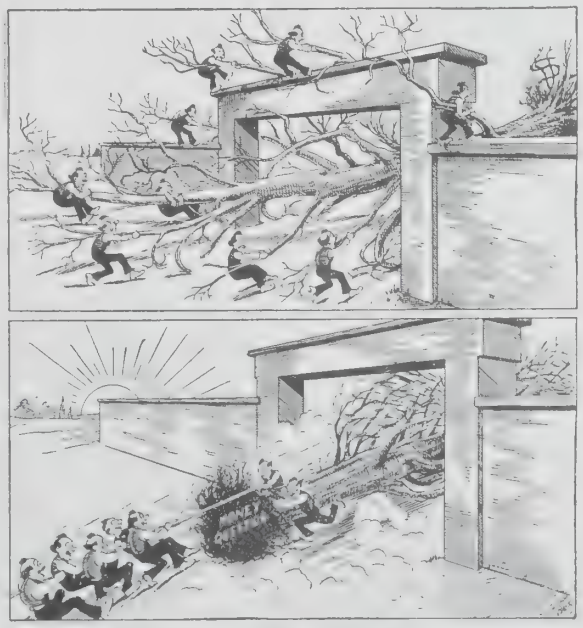
The argument ended here for a time. Neither had touched on the economy of the matter in dispute. The one had correctly stated the source of authority for a medium of exchange; the other ascribed to a certain class a higher degree of responsibility than any group can ever attain. It is possible a few points may be suggested which may tend to clear up what seems to many a difficult problem.

No man in his senses has ever advocated a currency system in which there are no limitations as to representative value and volume. Economists agree that if the standard must be a single commodity, that commodity should be one of the two so-called precious metals—gold or silver. All are also agreed that the paper substitutes for these metals are more convenient and preferable to coin, except in the fractional denominations, for hand-to-hand use, and that bank credits have properly superseded notes and coin in the larger transactions, because of the proprietary interest which they carry and convey, impossible in a note or coin, both of which are bearer credits belonging to the holder, whether stolen, found or acquired legitimately.

To another school of economists may be assigned the believers in a money unit based on the average value of two or more commodities, and to a third those who favor the use of the land as a basis. A fourth and smaller group would base the unit of money on the value of an hour of toil.

The history of money shows that its use has caused constant experimentation to arrive at an equitable medium of exchange, in which that function has been lost sight of in an effort to make it a stable measure of values. Hence we are now confronted with various propositions to stabilize the dollar in purchasing power of commodities which are constantly fluctuating in price, mistakenly supposed to be value.

That the amount of metal in an old-time coin matters little in its performance of the function as a medium



Above—How not to do it. Below—Doing it.

of exchange is exemplified by the English monetary unit, the pound sterling. Originally a pound troy of silver, the term now describes a unit of much smaller value and no material relation to its description as "sterling."

How strikingly inconsistent it is now to hear the statesmen of Great Britain, who have been for several years forcing their country through a drastic deflation to restore the gold parity of the emergency currency of the country, boast of honesty and integrity in the effort! That gold par would have been reached, or, more accurately, that gold value would have dropped to the level in purchasing power of the "Brad" was inevitable. Meanwhile the low-powered pound was doing the internal exchange of the country as well as sterling could. There was little unemployment, and the credit side of contracts was not given an advantage of the debit. Foreign exchange was adjusted to the varying fluctuations of the money of other nations.

British statesmen have not always been so obtuse. They adopted the single gold standard when that metal was the "cheaper" of the two at the legal ratio of coinage, and by thus debasing her *pound sterling* won the monetary prestige they are striving to regain. Intentionally or not, by demonetizing silver she cheapened that metal, and the pendulum was on the swing the other way until the gold discoveries in 1849. These were so great that, fearing American monetary supremacy, her financiers proposed a general demonetization of gold, and but for the refusal of France would have accomplished it.

But this is digression. We were undertaking to show that a currency based upon the good faith and credit of the nation—the words are those of the Federal Constitution—is secure. No sincere citizen will question the good faith of the United States of America. When Shylock hid his gold and silver at a time the dissolution of the Union was sought, Secretary Chase issued his paper promises to pay. The first lot, although of small volume, never sank below gold par, and to this day a few have never been presented for redemption. The succeeding lots were doctored in the Senate by the exemption clause, enabling Shylock to reap a rich premium in trading his gold for means to pay a debt sometimes borrowed in the depreciated currency. The United States deprived of other media of exchange by the National Bank Act followed for years the dictates of Shylock, even to the extent of cutting away half the historic base of all its money.

The credit of a nation is governed by the revenue it can derive from taxation. Taxation is limited by the ability and willingness of the people to be taxed. As was agreed between the disputants whose arguments open this review, nobody questions the ability of this country's credit to float a debt much greater than our present one, provided we pay interest on it; but to have the same debt represented in promises to pay made a legal tender in payment of all debts, public and private, would be wrong, they say. Let us see about it.

Three issues of outstanding government bonds have the circulation privilege. That is, upon deposit in the Treasury, currency will be issued to National Banks in their stead. These bonds are so eagerly sought, although carrying the lowest interest rate of any government obligation, that they have never failed to be quoted above par, when others have fallen far below. To those fearing inflation if all bonds are similarly endowed, it should be sufficient to say that the National Bank note circulation has never reached its authorized limit.

The issue of Reserve Bank currency is limited only by the offerings of eligible commercial paper for deposit in the Treasury, for there is no legal limit. Suppose there is an exchange of notes for bonds in the next financing of maturities, or a Treasury call for bonds to be so redeemed, where would be the danger?

If the entire national debt could be monetized it would cut off an interest charge of more than a billion dollars a year, and income taxes could be abolished with a big saving in the cost of maintaining an inquisition at once undemocratic and unjust.

John St. Helen as John Wilkes Booth

Story of the Saloonkeeper of Hood County, Texas—Fifth Article

By F. L. BLACK

WAS John Wilkes Booth shot in the Garrett barn or was it someone else? Before dealing with the proofs of identification, THE DEARBORN INDEPENDENT will give its findings with reference to the claims that the trinity, John St. Helen, of Texas, David George, of Oklahoma, and John Wilkes Booth, of Maryland, were one and the same man.

John St. Helen, of Granbury, Hood County, Texas, claimed that he was John Wilkes Booth. This, according to Finis L. Bates, to whom he made the alleged confession, occurred sometime between 1872 and 1878, while Mr. Bates was a "lawyer yet in his teens."

In January, 1921, a representative of THE DEARBORN INDEPENDENT had interviews with all persons in Granbury and Glenrose, Texas, who had been there in 1872-1878 or knew anything about John St. Helen, and their sworn statements were taken.

Mr. Bates states that this man St. Helen was one of his first clients and that he ran a saloon at Glenrose Mills, a few miles south of Granbury. Mr. Bates describes a trip to Glenrose made by him as "the orator of the day," with "General J. M. Taylor," at the invitation of St. Helen, for a Fourth of July celebration. (General Taylor, upon investigation, was found to have been an old soldier, who had never risen above the rank of private.)

Bates describes St. Helen as speaking at this meeting in a "full, clear voice," and using "choice and eloquent language." In a later description of St. Helen's voice, Bates says, "All this time his (St. Helen's) breath came hard, almost to a wheeze, superinduced by excitement, or what seemed to be a disease, possibly produced by exposure and bordering upon a bronchial or an asthmatic affliction of the throat and chest."

The history of Hood County says: "St. Helen had a serious impediment in his speech, caused from asthma, so he could rarely speak above a whisper."

D. L. Nutt, who with his brother figured largely in the affairs of Hood County, says that St. Helen had something wrong with his throat, which made him hoarse and wheezy. George M. Wright, also of Granbury, said that "St. Helen wheezed continuously. This wheeze was especially noticeable when he got a little excited."

St. Helen moved his business, about the year 1873, from Glenrose to Granbury and it is upon this point that Mr. Bates takes occasion to plant the suggestion that St. Helen received remittances from some mysterious source: "St. Helen's business did not seem to be a matter of necessity with him, as he at all times appeared to have more money than was warranted by his stock in trade, and he apparently took little interest in it and trusted at all times the waiting on of customers to his Negro or Mexican porter, while he was, in fact, a man of leisure, spending most of his time after his removal to Granbury in my office, reading and entertaining me after business hours, and in our idle moments in many other ways, but his favorite occupation was reading Shakespeare's plays, or rather reciting them as he alone could do."

W. W. Snyder, the man from whom St. Helen purchased the Glenrose saloon, states that the purchase price was one hundred and fifty dollars. D. L. Nutt who, according to old Granbury residents, was one of St. Helen's friends, states that "at no time did St. Helen ever have more money than he could have made in his business."

A. W. Crockett, who worked on the local newspaper, in which St. Helen carried an ad for his saloon, The Black Hawk, said that St. Helen never had any special amount of money and could not have received remittances from outside sources without its becoming known.

Captain J. H. Doyle, a resident of Granbury since 1870, who was in the merchandise business at the time, said that he "never knew or heard of St. Helen having more than an ordinary amount of money."

The theory is, of course, that if Booth were alive and a fugitive, his family or accomplices would be secretly supplying him with funds. Considerable emphasis was placed on these "mysterious remittances" by Mr. Bates, and every possible clue was run down in a vain effort to substantiate his claim. What is said with regard to St. Helen's remittances will serve all later phases of the Booth myth as well.

Mr. Bates, in conversations with the writer, indicated a number of leads that he claimed would prove that the family of John Wilkes Booth was making regular remittances to him as John St. Helen and later as David George. These were all carefully checked. One story will be sufficient to show how easily "delusion" may become "fact."

A man in Missouri had read a copy of the Bates book and thinking he had discovered the destination of funds secretly disposed of by his wife, whose grandfather's name had been Booth, called on Mr. Bates in Memphis. According to Mr. Bates this man suspected that his wife's money was being sent to a brother in Wisconsin, who he claimed was a cousin of John Wilkes Booth and acting as fiscal agent for the Booth family under the name of George E. Smith—the "mysterious Mr. Smith" whom we later discuss. The coincidence in family names was proof conclusive to the man from Missouri and Bates that they were on the right track. The writer was told by Bates that there had been frequent conferences between the alleged Wisconsin cousin and Edwin Booth.

JOHN WILKES BOOTH, above. The tintype of John St. Helen at the left, badly defaced by having been broken, which Bates claims was given him in Granbury, Texas, at the time St. Helen "confessed" he was John Wilkes Booth.

The Missouri man was interviewed in his home town. The story he told the writer did not agree in many details with that reported by Mr. Bates, who had claimed that the Missourian had documentary evidence to support his story, which was denied by this party at our interview. A thorough investigation made at the home of the alleged Wisconsin cousin showed absolutely no connection between his Booth family and that of John Wilkes and his only personal knowledge of Edwin Booth had been across the footlights as a spectator in a Chicago theater.

Mr. Bates asserts that St. Helen continually recited Shakespeare in his saloon and at public entertainments, read theatrical papers and talked about the stage. Was a man "kind in disposition, careless of self, thoughtful of others, leading his own life in soliloquy, reveling in the thoughts of the master minds of the past, was modest, unobtrusive, and congenial, ever pleasant in association with me. He was a social favorite with all with whom he came in contact yet, he was rather a social autocrat than a social democrat. Except for a select few he held all men to the strictest social etiquette, repelling all undue familiarity, refusing all overtures of social equality with even those of the better middle classes of men, but it was done in such a gentle and respectful way that no affront was taken—if such it could be called—it was more pleasant than otherwise, leaving the impression that he would be delighted to be on the most intimate terms with the other, but, as there is nothing in common between us more than a respectful speaking relation, it is an impossibility. And thus he made friends while he drew the social lines and pressed home a consciousness of his own superiority as an entertainer.

"The hours of our social life were pleasantly spent, not by riotous living, but by amusing games of cards, recitations and readings by St. Helen, which were always a great treat, and which he himself seemed to enjoy, as did his friends.

"St. Helen often admitted that in his younger days he sometimes drank to excess of strong whiskies, wines, and so forth, as also decoctions of brandy and cordials, but during our associations I never knew of his taking strong drink of any character, nor did he use tobacco in any form, and in the absence of these habits and tastes we were entirely congenial, as I myself had never cultivated appetites of this character. We were also lovers of literature of the same class, as well as music and the fine arts, and matters pertaining to the stage. We enjoyed the gossip of the stage, and the people of the stage came in for a large share of our attention, especially St. Helen's, who talked much of what he called the old and the new school of acting, with which I became conversant, which greatly pleased St. Helen, who frequently made reference to me as his trained associate, while he would explain that men became congenial by constant association linked together by the common mother, kindred thoughts, the offspring of blended characters."

A. P. Gordon, who came to Hood County in 1871 and who claims that St. Helen worked for him about a year before going into business for himself, does not agree with Mr. Bates' description. He states that "St. Helen kept away from public meetings and crowds, and never to my knowledge took part in any plays or entertainments. He never got dramatic unless warmed up with whisky. He was inclined to quote poetry both when sober and drunk, but I never saw him read any book or have any in his possession. He was considered a very wicked man and always went around with a pistol and knife. *I do not remember that St. Helen and Finis Bates were ever intimately acquainted,* and do not think it could have been possible, due to their difference in age and character. *Bates was just a young green kid and St. Helen was a hardened man of the world of at least forty.* St. Helen did not room here at Granbury in his saloon at night unless gambling all night, which he often did. Occasionally he slept outside, back of his saloon in a wagon, and claimed that he could breathe better when in the open."

Frank Gaston, editor Granbury *News,* said: "I was in Granbury during the time St. Helen was here. I was in his saloon several times, and once or twice I was also in his place at Glenrose. St. Helen was a typical saloon desperado. He had a quick eye and sometimes his eyes were rather wild looking. No one around here at that time thought St. Helen so strange and different, but, of course, many after they heard that he might be John Wilkes Booth thought him quite different."

George W. Wright, another resident, said: "I knew St. Helen quite well while he was here in Granbury. While I remember him quoting poetry, I do not remember of him ever making fine speeches; this would have been impossible anyway on account of his throat."

D. L. Nutt declared that: "He (St. Helen) was particularly a good friend of John Reed, who made most of his living by gambling. I've heard A. S. McCamant, county clerk at the time, say many times: 'St. Helen and Reed are rascals.' St. Helen drank a lot and was awfully drunk several times and could hardly get around. He and Bill McDonald were close friends; in fact, I think it was McDonald who brought St. Helen to Granbury in the first place. McDonald was a drinking and fighting man who got drunk frequently and was quite handy with the knife and cut John Green up pretty badly. St. Helen once started a fight in my place of business with a half-breed Indian by the name of Selvidge. St. Helen came in half-drunk and in a violent and vicious mood. Just how the fight started, I do not know, but the first thing I saw was Selvidge on the floor with 'Saint' on top of him. Bill McDonald was in the saloon and ran up with a knife to aid St. Helen. I grabbed Bill and pushed him out through the front door. When I turned I saw St. Helen going out the back door and found Selvidge back of the counter with a bloody knife. He had cut St. Helen across the back of the neck, opening the muscles, which left a bad scar." This story is also told in the history of Hood County.

Mr. Bates' descriptions of John St. Helen, when read to Granbury people who knew him, greatly amused them.

Next follows the alleged confession which, according to Bates, was made to him during a serious illness in which St. Helen thought he would die. This "confession" is quoted by Mr. Bates from memory more than thirty years after its alleged date, and after he had read the current story of the assassination. Mr. Bates says he did not believe the "confession" at the time, and, therefore, did not take notes.

According to Mr. Bates, it began by St. Helen saying:

"'I am dying. My name is John Wilkes Booth and I am the assassin of President Lincoln. Get a picture of myself from under the pillow. I leave it with you for my future identification. Notify my brother, Edwin Booth, of New York City.'"

Then followed a recital of the Booth family history, which was of previous general newspaper knowledge. The instigator of the crime is then claimed in the "confession" to have been Andrew Johnson, the Vice-President, who desired the Presidency and played upon the southern sympathies of John Wilkes Booth to execute his purpose. The St. Helen "confession" goes on to say that preparatory to an attempt to kidnap Lincoln, "'David E. Herold [the conspirator captured with Booth] and I left Washington, D. C., to a point near Richmond. Returning, we stopped the night of the 13th day of April, 1865, at the old Surrattville tavern, ten miles south of Washington.'" [*This was the night before the assassination.*]

The testimony of C. D. Hess, manager of Grover's Theater, Washington, shows that Booth spent some time in the theater that afternoon. The "confession" and the known facts are impossible to reconcile on this point.

The "confession" declared that on the morning of the fourteenth Booth and Herold in their attempt to enter Washington were stopped by Federal troops at the East Potomac bridge and held there until 2 o'clock in the

afternoon; "'where we made satisfactory explanations and were permitted to enter the city and went straight to the Kirkwood Hotel arriving about 3 o'clock.'"

The fact is that Booth had his hair trimmed in Washington about 9 a. m. that day by Charles Wood, barber. At 11:30 to 12:30 a. m. he called at Ford's Theater for his mail and was seen by H. Clay Ford, Thomas J. Raybold, James J. Gifford, Louis J. Carland and James W. Pumphry. At 12:30 he was seen at the corner of Tenth and E streets by James R. Ford. Soon after 2:30 p. m. he was seen at Mrs. Surratt's home on H street, between Sixth and Seventh, by Louis J. Weichman and Miss Anna E. Surratt; between 2:00 and 3:00 p. m. he was seen at the back door of Ford's Theater by Mary Jane Anderson; between 2:00 and 4:00 p. m. he was seen near the theater by James R. Ferguson; and at 4:00 p. m. on Pennsylvania Avenue by John Matthews. John Wilkes Booth is thus quite definitely accounted for, and St. Helen's "confession" so far does not agree with the evidence.

Then the "confession" describes a call on Vice-President Johnson at 3 o'clock at the Kirkwood Hotel, and his declaration to Johnson of an intention to abandon further attempts to kidnap Lincoln:

"'When Vice-President Johnson turned to me and said, in an excited voice and apparent anger: "Will you falter at this supreme moment?" I could not understand his meaning, and stood silent, when with pale face, fixed eyes and quivering lips, Mr. Johnson asked of me: "Are you too faint-hearted to kill him?" As God is my judge, this was the first suggestion of the dastardly deed of the taking of the life of President Lincoln, and came as a shock to me. While for the moment I waited and then said: "To kill the President is certain death to me," and I explained to Vice-President Johnson that I had just been arrested by the guard as I was coming into the city over the East Potomac bridge that morning, and that it would be absolutely impossible for me to escape through the military line, should I do as he suggested, as this line of protection completely surrounded the city. Replying to this Mr. Johnson said: "General and Mrs. U. S. Grant are in the city, the guests of President Lincoln and family, and from the evening papers I have learned that President Lincoln and wife will entertain General and Mrs. Grant at a box party to be given in their honor by the President and Mrs. Lincoln at Ford's Theater this evening."

"'At my suggestion Vice-President Johnson assured me that he would so arrange, and see to it himself, that General and Mrs. Grant would not attend the theater that evening with the President and his family, and would also arrange for my certain escape. I replied: "Under these conditions and assurances I will dare strike the blow for the helpless, vanquished Southland, whose people I love." Mr. Johnson left the room and after a little more than an hour returned, saying that it had been arranged as he had promised, and that General Grant had been or would be suddenly called from the city and that, therefore, he and his wife could not attend the theater that evening with the President and Mrs. Lincoln, as had been prearranged, and that such persons as would attend and occupy the box at the theater with the President and wife would not interfere with me in my purpose and effort to kill the President, and this he thought an opportune time, and that I would be permitted to escape by the route over which I had entered the city during the forenoon of that day.'"

(Major Rathbone's and Miss Harris' statements at the conspiracy trial show that the Major made every effort to apprehend the assassin, and was severely wounded by Booth in the attempt, which disproves the alleged statement of St. Helen that the parties would not interfere, since they actually did.)

The "confession" continues: "'That is, that I was to go out over the East Potomac River bridge, that the guards would be called in from this point by order of General C. C. Augur that afternoon or evening, but if there should be guards on the bridge, I was to use the password "T. B." or "T. B. Road," by explanation, if need be, which would be understood by the guards, and I would be permitted to pass and protected by himself (Mr. Johnson) absolutely in my escape, and that on the death of President Lincoln, he (Vice-President Johnson) would become President of the United States, and that in this official capacity I could depend on him for protection and absolute pardon, if need be, for the crime of killing President Lincoln, which he had suggested to me and I had agreed to perform.

"'I began the preparation for the bloody deed by going to Ford's Theater, and, among other things, arranging the door leading into the box to be occupied by Mr. Lincoln, which had already been decorated for the occasion, so that I could raise the fastenings, enter the box and close the door behind me so that it could not be opened from the outside, and returned to the Kirkwood Hotel. I then loaded afresh my derringer pistol so that she would not fail me of fire, and met Vice-President Johnson for the last time and informed him of my readiness to carry out the promise I had made him. About 8:30 that evening we left his room, walked to the bar in the hotel and drank strong brandy in a silent toast to the success of the bloody deed. We walked from the barroom to the street together, when I offered my hand as the last token of goodby and loyalty to our purpose, and I shall not forget to my dying day the clasp of his cold, clammy hand when he said:

"'"Make as sure of your aim as I have done in arranging for your escape. For in your complete success lies our only hope."

"'I replied, "I will shoot him in the brain."

"'"Then, practically, from this time I am President of the United States," replied Vice-President Johnson, and he added, "Goodby."'"

According to Atzerodt, who was *selected to kill Johnson,* at the hour St. Helen claimed he was with Johnson, Booth, Herold, Payne, and Atzerodt were together at the Herndon House.

The absurdity of St. Helen's alleged statements is shown when compared with the letter left by Booth for the *National Intelligencer,* his diary, and Payne's statement. (See THE DEARBORN INDEPENDENT, April 4, page 15.)

This suggestion that Andrew Johnson was implicated in the assassination is not new. It was first made by a southern leader, Beverly Tucker, in a letter addressed "To the People of the United States," which was published in the newspapers during May, 1865. A wild charge was made by President Johnson in his Proclamation of May 2, 1865, that certain Southern leaders, Tucker among them, planned Lincoln's murder. Tucker retaliated, asking how the South could benefit by Lincoln's murder, and, in a wildness equal to Johnson's, Tucker charged Johnson with the murder as he was the only visible beneficiary, having succeeded to the Presidency. Both men were wrong. No evidence has ever been found to support the charges of either.

During the impeachment trial of Andrew Johnson, witnesses were heard in an attempt to link Johnson with the assassination, but the main witness was found to have perjured himself. The enemies of President Johnson then abandoned the charge. There is ample evidence of the highest historical character of Andrew Johnson's complete loyalty, which may easily be found by anyone interested. The attempt of Bates and the "confession" to show that Johnson was a friend of the South, because he was southern born, and that he would be of more service to the South if Lincoln were removed, is refuted by the facts. Johnson's administration was marked by a severity toward the South that Lincoln would have repudiated in every respect. Had St. Helen been John Wilkes Booth he would have known that in a speech given April 5, 1865 (nine days before the assassination) Vice-President Johnson spoke of the necessity of proper punishment of the Confederate leaders. Speaking of Jeff Davis, Mr. Johnson said: "Yes, I say hang him many times." Mr. Johnson then went on to say that the Confederate leaders should be treated as traitors and their property confiscated.

Continuing Mr. Bates' story of the "confession," St. Helen describes how he entered the box and shot the President and—

"'As I fired, the same instant I leaped from the box to the stage, my right spur entangled in something in the drapery on the box, which caused me to miss my aim or location on the stage, and threw my shin bone against the edge of the stage, which fractured my right shin bone about six or eight inches above the ankle.'"

Mr. Bates says: "At this point St. Helen exposing his shin called attention to what seemed to be a niched or uneven surface on the shin bone. This I did not notice closely, but casually it appeared to have been a wound or fracture."

At the conspiracy trial (Pittman Report, Page 87) May 13, 1865, a long riding boot, for the *left foot,* slit up in front for about eight inches with the name John Wilkes written in it, which had been found at the home of Dr. Samuel Mudd, Friday, April 21, and which Dr. Mudd said he had cut off Booth's leg, was offered in evidence. The boot is now in the secret archives of the War Department, Washington, D. C., and *is a left boot.* The "confession" says that it was *St. Helen's right leg that was broken.*

Had St. Helen been John Wilkes Booth, he would not have made the absurd statement that he broke his leg by throwing his "'shin bone against the edge of the stage.'" The presidential box of the Ford Theater was back of the edge of the stage, and as Booth jumped his right spur caught on the flag, throwing him heavily on his *left foot and injuring it.*

The "confession" then deals with the flight:

"'From the stage I reached my horse in safety, which by arrangement was being held by David E. Herold, back of the theater and close to the door of the back entrance. With Herold's assistance I mounted my horse and rode away with full speed without hindrance, and reached the bridge at the East Potomac River, crossing the same with my horse at full pace.'"

[The horse was held by a boy, Joseph Burroughs, who was connected with the theater. Herold was not even back of the place.]

"When I came to the gate across the east end of the bridge there stood a Federal guard, who asked me a question easy to answer:

"'"Where are you going?"

"'I replied, using the simple letters "T. B.," as I had been instructed, and the guard then asked:

"'"Where?"

"'I then replied, "T. B. Road," as I had been instructed by Mr. Johnson, and without further question the guard called for assistance to help raise the gate quickly, when I at once again urged my horse to full speed and went on to Surrattville, where I waited for Herold to overtake me, as prearranged, whom I expected to follow closely behind.

"'After waiting a few minutes Herold came up and we rode the remainder of the night until about 4 o'clock on the morning of the 15th of April, 1865, when we reached the home of Dr. Samuel Mudd, where Dr. Mudd, by cutting a slit in it, removed my riding boot from the *injured right foot and leg* and proceeded to dress it by bandaging it with strips of cloth and pieces of cigar boxes, and the riding boot was left at the home of Dr. Mudd, where we remained during the rest of the day, and at nightfall proceeded on our journey, *my bootless right foot* being covered only by the sock and the leg as bandaged and splintered by Dr. Mudd.'"

[Nothing is said about the stop at the Surratt Tavern for the arms. Note the repetition of *right leg* when it was the *left boot* that was cut off by Dr. Mudd.]

"'From the home of Dr. Mudd I went to the home of a southern sympathizer by the name of Cox, which we reached between 4 and 5 o'clock on the morning of the 16th day of April, 1865. Mr. Cox refused to admit us into his house, the news of the death of President Lincoln having preceded us, and he feared for this reason to take Herold and me in. But he called his overseer, or manager about the place, and instructed him to hide us in a pine thicket on or near the banks of the Potomac River, just back of and near his plantation. This man, the overseer, was of medium size, approximately my weight, but not quite so tall, I should say, swarthy complexioned, black hair and eyes, with a short growth of whiskers over his face. I called him by that familiar cognomen known to the Confederate soldiers, "Johnny." I have the impression, whether correct or not I cannot say, from having heard his name called by a Mr. Jones, a relative of Mr. Cox, that it was Ruddy or Roby, but heard this only a few times. Of course, this may have been a given name, nickname or surname, I don't know how this was; I was not specially interested in knowing his name and was with him but a short while, having negotiated with him to put us across the country and into the care and protection of the Confederate soldiers.' [Refer to Jones story in THE DEARBORN INDEPENDENT of April 4, page 9. The overseer was Franklin Robey.]

"'Ruddy told me (if this be his name) that some of Colonel Mosby's command of Confederate troops were then encamped not far south of the Rappahannock River at or near Bowling Green, Virginia, and agreed to convey and deliver us to these Confederate troops for a price, as I now best remember, about three hundred dollars. Ruddy, as we will call him, left us in our hiding place until he could go to Bowling Green, some thirty-five miles or more distant, with a view of arranging with some of these soldiers to meet us at a fixed time and place—proposedly on the Rappahannock River, which was then about the dividing line between the contending Federal and Confederate armies.

"'Ruddy left and did not return for several days, from say the 16th or 17th to the 21st of April, 1865. Herold and I were cared for during his absence by Mr. Jones, the relative, I think, half-brother of Mr. Cox. On Ruddy's return he reported that the desired arrangements had been made with Captain Jett and others of Mosby's command, then stationed at Bowling Green, Virginia [The records show that Mosby was at Winchester, 90 miles northwest of Bowling Green.], south of the Rappahannock River, to meet us at the ferry on the Rappahannock River at Ports Conway and Royal, as early as 2 o'clock p. m. of April 22, 1865. So we immediately started for this point on the night of the 21st of April, crossed the Potomac River, reaching the south side of the Potomac River. We then had about eighteen miles to go from the Potomac to the Rappahannock River to the point agreed upon.'"

The "confession" then describes the trip to Port Conway, lying down in the Negro's wagon, "'Herold and Ruddy following along in the wake of the wagon, some distance behind. In my side coat pocket I had a number of letters together with my diary, and I think there was a picture of my sister, Mrs. Clark, all of which must have worked out of my pocket en route or came out as I was hurriedly taken from the wagon. Just as we drew up at the ferry old Lewis called out:

"'"Dar's dem soldiers now."

"'And at the same moment some one began tearing away the things from the back gate of the wagon, who proved to be Herold and Ruddy, much to my relief, as they had begun unceremoniously to remove the back gate of the wagon, which necessarily excited me very much, as the driver did not say Confederate soldiers, and the

(Continued on page 13)

The ferry landings as they are today, Port Conway (above), Port Royal (below), where Booth and Herold crossed the Rappahannock River, and Monday, April 24, 1865, met the three Confederate officers, Jett, Ruggles and Bainbridge.

Paul Revere Tells His Own Story

His Midnight Ride in the Cause of Liberty to Lexington a Century and a Half Ago

By FRANK DORRANCE HOPLEY

"Listen, my children, and you shall hear
Of the midnight ride of Paul Revere,
On the eighteenth of April, in seventy-five;
Hardly a man is now alive who remembers
That famous day and year."

THUS did Henry Wadsworth Longfellow begin his immortal poem on the famous ride of the Minuteman Paul Revere, on that April night, one hundred and fifty years ago. Of recent years there have been some critics—those who delight to tear down traditions—who have asserted that Paul Revere did not take that ride at all. They tell us that he, and another Minuteman, by the name of William Dawes, started together, but that Revere was captured at the outset, and it was Dawes who rode through the countryside warning of the approach of the British, while Revere received all the credit.

As long ago as 1798, however, there was found in a parcel of old letters by a member of the Massachusetts Historical Society, one from Paul Revere which gives an account of his ride to Lexington. This letter is undated but it is thought to have been written some time after the battle of Lexington, and was addressed to a Dr. Belknap.

The letter was first printed in a collection of letters by the Massachusetts Historical Society under date of January, 1798, and was republished in the proceedings of that society in November, 1878.

Telling of his ride, Paul Revere says in part:

"Having a little leisure I shall try to fulfill my promise of giving you the facts and anecdotes prior to the battle of Lexington. . . .

"In the fall of 1774 and winter of 1775 I was one of upward of thirty, chiefly mechanics, who formed ourselves into a committee for the purpose of watching the movements of the Tories. We held our meetings in The Green Dragon Tavern.

"We were so careful that our meetings should be kept secret, that every time we met every person swore upon the Bible that he would not discover any of our transactions but to Messrs. Hancock, Adams; Doctors Warren, Church and one or two more. . . .

"In the winter, toward the spring, we frequently took turns, two by two, to watch the soldiers by patrolling the streets all night. The Saturday night preceding the 19th of April, about twelve o'clock at night, the boats belonging to the transports were all launched and carried under the sterns of the men-of-war. From this movement we expected something serious was to be transacted.

"On Tuesday evening, the 18th, it was observed that a number of soldiers were marching toward the bottom of the Common. About ten o'clock Dr. Warren sent in great haste for me and begged that I would immediately set out for Lexington, where Messrs. Hancock and Adams were, and acquaint them of the movements. When I got to Dr. Warren's house I found that he had sent an express by land to Lexington—a Mr. William Dawes. I returned that night through Charlestown where I agreed with Colonel Conant, and some other gentlemen, that if the British went by water, we would show two lanthorns in the North Church steeple, and if by land, one, as a signal. . . .

"I left Dr. Warren's and called upon a friend and desired him to make the signals. I then went home, took my boots and surtout, went to the north part of the town where I kept a boat; two friends rowed me across the Charles River, a little to the eastward where the *Somerset,* man-of-war, lay. It was then a young flood, the ship was winding, and the moon was rising.

"When I got into Charlestown, I met Colonel Conant and several others; they said they had seen our signals. I told them what was acting and went to get a horse. I got a horse of Dr. Larkin. While the horse was preparing, Richard Devons, Esq., who was one of the Committee of Safety, came to me and told me that he came down the road from Lexington after sundown that evening; that he met 10 British officers, all well mounted and armed, going up the road.

A historical spot. From this tower of the Old North Church, Boston, Massachusetts, General Gage, in command of the British forces, saw his troops receive a severe beating at Bunker Hill. Also it was from this spire that Paul Revere received the lantern signal which sent him on his mission of arousing the American colonists.

Monroe Tavern, Lexington, Massachusetts, one of the most noted spots of the town, which is visited daily by American followers of the early life of the colonial states. It was here that Lord Percy, in command of the English soldiers, was stationed before the fight with the American Minutemen, and was later used as a hospital for his troops. The tavern was built in 1695.

"I set off upon a very good horse; it was then about eleven o'clock and very pleasant. After I had passed Charlestown Neck, and got nearly opposite where Mark was hung in chains, I saw two men on horseback under a tree. When I got near I discovered they were British officers. One tried to get ahead of me and the other to take me. I turned my horse very quick and galloped toward Charlestown Neck, and then pushed for the Medford road. The one who chased me, endeavoring to cut me off, got into a clay pond, near where the new tavern is now built. I got clear of him and went through Medford, over the bridge and up to Menotony. In Medford I woke the captain of the Minutemen; and after that I alarmed almost every house, till I got to Lexington.

"I found Messrs. Hancock and Adams at the Rev. Mr. Clarke's. I told them my errand and inquired for Mr. Dawes. They said he had not been there. I related the story of the two officers, and supposed that he must have been stopped, as he ought to have been there before me. After I had been there about half an hour, Mr. Dawes came. We refreshed ourselves, and set off for Concord to secure the stores, and so forth, there. We were overtaken by a young Dr. Prescot, whom we found to be a high son of liberty. I told them of the 10 officers that Mr. Devons met and that it was possible that we might be stopped before we got to Concord, for I supposed that after night they divided themselves, and that two of them had fixed themselves in such passages as were likely to stop any intelligence from going to Concord. I likewise mentioned that we had better alarm all the inhabitants till we got to Concord. The young doctor much approved of it, and said he would stop with either of us, for the people between there and Concord knew him, and would give more credit to what he said.

"We had got nearly halfway. Mr. Dawes and the doctor stopped to alarm the people of a house. I was about 100 yards ahead, when I saw two men in nearly the same situation as those officers were near Charlestown. I called the doctor and Mr. Dawes to come up. In an instant I was surrounded by four. They had placed themselves in a straight road that inclined each way. They had taken down a pair of bars on the north side of the road, and two of them were under a tree in the pasture. The doctor being foremost, he came up and tried to get past them, but they, being armed with pistols and swords, forced us into the pasture. The doctor jumped his horse over a low stone wall and got to Concord.

"I observed a wood at a small distance and made for that. When I got there, out started six officers on horseback and ordered me to dismount. One of them who appeared to have command, examined me, where I came from, and what my name was. I told him. He asked if I was an express. I answered in the affirmative. He demanded what time I left Boston. I told him, and that I had alarmed the country all the way up. He immediately rode toward those who stopped us, when all five men came down on a full gallop; one of them, whom I afterward found to be a Major Mitchell of the Fifth Regiment, clapped his pistol to my head, called me by name, and told me he was going to ask me some questions, and if I did not give him true answers he would blow my brains out.

"He then ordered me to mount my horse after searching me for arms. He ordered them to advance and to put me in front. When we got to the road they turned down toward Lexington. The Major ordered if I attempted to run, or if anybody insulted them, to blow my brains out.

"We rode until we got near Lexington meeting house, when the militia fired a volley of guns, which appeared to alarm them very much. The Major inquired of me how far it was to Cambridge, and if there was any other road, and so forth.

"After some consultation the Major rode up to the Sergeant and asked if his horse was tired. He answered him, he was. Then he said, 'Take that man's horse.' I dismounted and the Sergeant took my horse, when they all rode toward Lexington meeting house.

"I went across the burying ground and some pastures and came to the Rev. Mr. Clarke's house, where I found Messrs. Hancock and Adams. I told them of my treat-

The Minuteman Statue, at Lexington, Massachusetts, which marks the spot where the first defenders of the states stood against the British troops when the first shot was fired "that was heard round the world." Lexington is a shrine of all patriotic Americans, thousands visiting the town to go over the sites of the Revolution.

John St. Helen as John Wilkes Booth

(Continued from page 11)

"soldiers" referred to flashed through my brain as being Federal soldiers. But before I can tell you, the back of the wagon was taken away, I was pulled out by the heels by Herold and Ruddy, and at once hustled into the ferryboat and over the river, where our Confederate friends were waiting for us. They, in fact, being the "soldiers" referred to by Lewis, the driver.

"'In the hurry, as well as the method of taking me from the wagon, I think the letters, diary and picture of my sister were lost from my pocket, as I was dragged out. About this I can't say, but I do know that after I had crossed the river and was feeling in my pocket to get the check, which I had on a Canadian bank, and with which I paid this man Ruddy for his services he had rendered us, for an amount, as I now remember it, of about sixty pounds, I discovered I had lost these papers. I asked Ruddy to go back over the river and get them out of the wagon, if they were there, and bring them to me at the Garrett home, where the soldiers had arranged to take me until Herold and Ruddy should go to Bowling Green, Virginia, that afternoon, it being then about 2 o'clock. [Statements made by the elder Garrett, Jett, Bainbridge, and Ruggles disprove any previous arrangement for taking Booth to the Garrett home.]

"'This man Ruddy stepped into an old batteau boat to go over to the wagon and get these papers after I handed him his check. We being too exposed to wait for his return, I hurriedly rode away with the two gentlemen to whom I had been introduced as Lieutenants Ruggles and Bainbridge, to the Garrett home, mounted on a horse belonging to the man to whom I had been introduced as Captain Jett. These gentlemen, as I understood it, were connected with Mosby's command of Confederate soldiers. But before separating at this ferry it had been understood between Herold, Ruddy and myself that they would go to Bowling Green, Virginia, that afternoon, in company with Captain Jett, on foot, by a near way, for the purpose of getting me a shoe for my lame foot and such other things as Herold and I needed and that could not be obtained at Ports Conway and Royal, and they were to return and meet me the next day at the Garrett home, where Ruddy would deliver to me the papers mentioned, if recovered.

"'The Garrett home, I should say, is about three miles north of the public road crossing the Rappahannock River at Ports Conway and Royal and leading in a southerly direction to Bowling Green, Virginia. From the ferry we went out the Bowling Green road a short distance westerly; we then turned and rode north on a country or bridle road for a distance of about three miles and a half, when we reached the Garrett home, where Lieutenants Bainbridge and Ruggles left me, but were to keep watch in the distance over me until Ruddy and Herold returned, which they were expected to do the following day, it being some twelve or fifteen miles' walk for them. They were to remain there (at Bowling Green) overnight of the day they left me and return the following day.

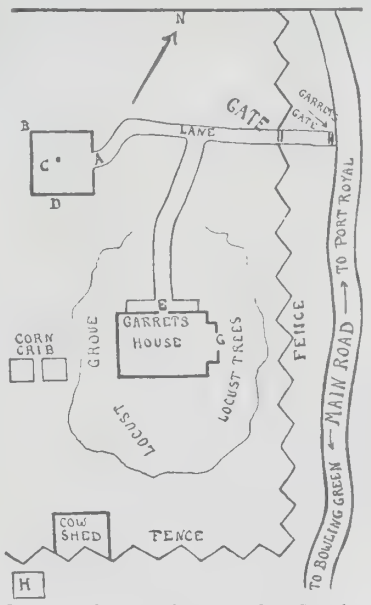
"'About 1 or 2 o'clock in the afternoon of April 23, 1865, the second day of my stay at the Garrett home [The testimony of Jett, and statements of the Garretts, Bainbridge, and Ruggles show that Booth and Herold did not arrive at the Garrett home until Monday afternoon, April 24.—F. L. Black.], I was out in the front yard, lounging on the meadow, when Lieutenants Bainbridge and Ruggles came up hurriedly and notified me that a squad of Yankee troops had crossed the Rappahannock River in hot pursuit of me, and advised me to leave at once and go back into the woods north of the Garrett house, in a wooded ravine, which they pointed out, giving me a signal whistle by which I would know them, and hurriedly rode off, saying that they would return for me in about an hour at the place designated, and bring with them a horse for my escape.

"'I left immediately, without letting anyone know that I had gone or the direction I had taken. I reached the woods at about the place which had been pointed out to me, as nearly as one could traveling in a strange wooded section with the impediment of a lame leg. At about the time fixed I was delighted to hear the signal, and answered, to the best of my recollection, about 3 or 4 o'clock p. m. My friends came up with an extra horse, which I mounted, and we rode away in a westerly direction, riding the remainder of the afternoon and the following night until about 12 o'clock, when we camped together in the woods, or rather dismounted to rest ourselves and horses until daylight. We talked over the situation, they giving me directions by which I should travel. When we at last separated in a country road, they said about twenty or twenty-five miles to the west of the Garrett home or Ports Royal and Conway; I, of course, thanked them and offered them pay for the services they had rendered me and the price of the horse they had turned over to me, all of which they refused to accept, and bade me goodby, with the warning that I should keep my course well to the westward for that day's ride, and then, after this day's ride, continue my journey to the southwest.'" [The absurdity of this part of St. Helen's "confession" is easily seen by comparing it with the sworn statements of the men he mentions—Jones, Jett, Bainbridge, Ruggles, Rollins, and the Garretts.]

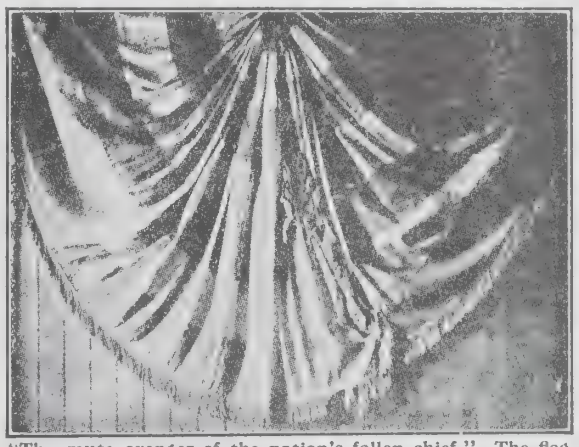
"'As advised by them, I rode on westerly through all the country roads as I came to them leading in that direction until about 10 o'clock a. m. of the second day out from the Garrett home, when, owing to the fatigue of myself and horse, and suffering from my wounded leg, I found it necessary to rest and stopped at a small farmhouse on the country road, where there seemed to live only three elderly ladies, who, at my request, took me in as a wounded Confederate soldier, fed my horse, and gave me breakfast, and as I now best remember, I compensated them, paying them one dollar in small silver coin.

"'After a few hours' rest for myself and horse, I pushed on toward the west the remainder of the day and the fore part of the night, as best I could, but early in the night I rode into the thick brush located in a small creek bottom some distance from the road and remained there all night. The next morning I obtained breakfast for myself and feed for my horse from an elderly gentleman and lady at a little country home at an early hour without further incident and interest, save and except the enjoyment of the meal, when I turned my course to the southwest, as I had been directed, and followed this direction day after day, impersonating the character of a Confederate soldier. Continuing on down through West Virginia, I crossed the Big Sandy River at Warfield, in Eastern Kentucky, and after traveling from Warfield for about two days, and covering a distance of fifty or sixty miles in a southwesterly direction from Warfield, I, as well as my horse, was about worn out, and I was therefore compelled to rest for about a week, claiming to be a wounded Confederate soldier. The parties with whom I stopped was a widow lady and her young son, whose name I cannot now remember. But after receiving their kind attentions and needed rest, I resumed my journey with the purpose of traveling to the south until I could reach the Mississippi River at a safe point for crossing it, and find my way into the Indian Territory as the best possible hiding place, in my opinion.

"'I finally reached without incident worthy of mention the Mississippi River and crossed the same at what was called Catfish Point, in the State of Mississippi. This point is a short distance south of where the Arkansas River empties into the Mississippi River. I followed the south and west bank of the Arkansas River until I reached the Indian Territory, where I remained at different places, hiding among the Indians for about eighteen months, when I left the Indian Territory and went to Nebraska and was at Nebraska City employed



Plan of Garrett place made soon after Booth was shot.
A. Door through which the dying man was brought.
B. Corner at which the barn was fired.
C. Spot in the barn on which Booth stood.
D. Point where Corbett fired.
E. Porch where Booth died.
G. Kitchen door at which Lieutenant Baker knocked.
H. Shed.



"The mute avenger of the nation's fallen chief." The flag in which Booth caught his spur as he jumped from the box after shooting Abraham Lincoln.

by a white man to drive a team connected with a wagon train going from Nebraska City, Nebraska, to Salt Lake City, Utah. This man was hauling provisions for the United States Government to the Federal troops encamped at Salt Lake City. But I left this wagon train while en route, just before we got to Salt Lake City, and proceeded to San Francisco, California, to meet my mother and brother, Junius Brutus Booth. After meeting my mother and brother and remaining a while there, I left and went into Mexico. From there I went up through Texas, finally stopping at Glenrose Mills and Grandberry, Texas, where we are now.'"

A sudden and suspicious vagueness comes over the "confession" after the Garrett place is left. That is to say, as soon as the narrative leaves the proved and accepted state of facts, details, dates, places, names are missing. From the Garrett place on, the point from which the Booth myth must be proved, nothing tangible is given. Up to this point there was some historical basis for the alleged St. Helen story. It loosely parallels the known facts; but from here on there is nothing on which to base even an imaginative tale. It is rather strange that when the facts about Booth cease, the alleged facts about St. Helen, as given in his "confession," are not even coherent. For here surely was Booth's great story—the assassin of Lincoln roaming unknown and unrecognized among the people. Would Booth's dramatic sense have been blind to that? Bates then describes later discussion he had with St. Helen with reference to some of the details of the "confession."

In his "confession," St. Helen in one place claims: "'For instance, I knew nothing of the plan to take the life of Secretary Seward on the night of the assassination of President Lincoln, or at any other time, showing that it would appear to have been a conspiracy against both the President and certain members of the Cabinet.'"

Reference to the confessions of Atzerodt, and Payne, the man who attempted the assassination of Secretary Seward, clearly shows that Booth did know of Payne's plans for Seward's assassination.

Mr. Bates asked: "'Did not the government of the United States announce to the American people, and as for that matter, to the civilized world, that Booth was killed and the death of President Lincoln avenged? Then do you say it is a fact that Booth was not killed at the Garrett barn in Virginia? It is a physical fact that some man was killed at the Garrett home. If not Booth who was this man?'"

"St. Helen replied by saying, 'As you have heard that a man was killed at the Garrett barn, and without positive or direct proof as to who this man was, yet from the circumstances I would say that it was Ruddy, the man with whom I had negotiated for my personal deliverance, together with that of my accomplice, David E. Herold, to the Confederate soldiers. You will remember I paid this man with a check made payable to my order by a Canadian bank, and if he did, as I requested, which he promised to do and left me to do, he got my letters, pictures, et cetera, out of the wagon, as I have explained to you, as he was to bring them to me at the Garrett home on the day or night following the day that I left the Garrett home, as I have also explained to you. I take it, without personal knowledge of the facts, that Ruddy and Herold came to the Garrett home, as prearranged and promised when we separated at the ferry on the Rappahannock River, so that the Federal troops, by some means, traced me to the Garrett home, where they found Herold and Ruddy, killing Ruddy and capturing Herold. They found on the body of Ruddy the check for sixty pounds, together with my letters, and I think a picture, and by reason of finding these belongings of mine on the body of Ruddy, I presume they identified it as the body of myself.'"

St. Helen has Booth leaving the Garrett's on April 23. The man who was shot in the barn was killed on the morning of the twenty-sixth. Mr. Bates in conversation February 9, 1921, admitted that there is some discrepancy here, but could not explain it. Even if Booth had lost his papers in the bottom of the Negro Lucas' wagon, is it reasonable to suppose that he also lost his knives, his pocket compass and the initialed pin from his undershirt, all of which were found on the man who was shot?

Mr. Bates later claims that he located a "large family of people by the name of Ruddy living within the immediate neighborhood of Samuel Cox."

THE DEARBORN INDEPENDENT, in 1921, pursuing the investigation in Southern Maryland, had the following statement from A. W. Neale, an old resident of La Plate, about five miles from the old Cox home:

"Colonel Samuel Cox was a strong and dominant man; but I would not say that he ruled the neighborhood in which he lived. There were many men in the neighborhood as strong and dominant as he. I also knew Tom Jones and Franklin Robey well. Tom Jones had a regular 'poker face.' You could not tell from his face whether he was betting on a pair of deuces or a straight royal flush. I never heard of a man named Ruddy in this country. Ruddy is probably intended for Robey."

John Garner, in a sworn statement made July 25, 1921, said:

"I am 82 years old and have lived in this neighborhood all my life, and remember quite clearly events happening during the Civil War, 1860-1865.

"At the time of the assassination of President Lincoln I was living down on the 'Neck,' not far from the home of Thomas A. Jones. I knew him, 'Colonel' Samuel Cox of Cox's Station, and Franklin Robey, 'Colonel' Cox's overseer, all quite well. I also was well acquainted with George Atzerodt, who was hung as one of the conspirators. I went hunting with him a good many times when we were boys together.

"Atzerodt, as a boy, didn't have good 'horse sense' and when he grew up he became quite a drinker and a 'good for nothing.'

"Colonel Cox was a wealthy and pompous man and practically ruled this section of the country. Tom Jones was a foster brother of 'Colonel' Cox and a contraband runner across the Potomac River during the Civil War. He was arrested and imprisoned for this several times. Jones was the type of man who could put on a 'long' face and be the most innocent looking fellow in the world when he wanted to.

"Franklin Robey was Colonel Cox's overseer. He was a quiet sort of man who didn't say much unless religiously aroused. He was a Shouting Methodist by religion, and his sport was fox hunting.

"These three people, Colonel Cox, Tom Jones, Franklin Robey, and an old Negro by the name of Woodland, who worked for Jones, are the only ones I ever heard of being connected with the care of Booth and Herold at Cox's place. Jones took them from there to the Potomac. I have never heard of a family of Ruddys and am sure no one by the name of Ruddy ever lived around Cox's station.

"Franklin Robey, I know, was alive thirty-two years ago, for I moved into the place I am now living at that time, and after I moved Robey spent a night with us.

"Robey always claimed that he had very little to do with the care of Booth and Herold; that Jones was really the man who cared for them.

"About the time Robey was here last, Tom Jones had been convinced by a young fellow by the name of Mattingly that he should write a book about Booth and that they—Jones and Mattingly—would sell it at the World's Fair in Chicago in 1893. They went to Chicago and tried to sell it from a tent. Jones was inside the tent, and Mattingly stood outside telling the crowd that the man who aided John Wilkes Booth to escape was inside and would sell them copies of his book which told the story. An old Union soldier stepped up and said that he was a boyhood friend of Abe Lincoln and

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. The set includes: "The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

The music of the carillon of St. Martin's Church, Groningen, Holland, is followed by the appearance of a watchman successively on each of the balconies facing each point of the compass, who sends out a trumpet strain, reminding the sleeping city that "all is well."

Japan's 1924 commerce with China showed a heavy gain. Exports amounted to 449,201,000 yen as against imports of 295,012,000 yen.

The Soviet government has closed the camp at the head of Aldon River where gold has been found, and no additional prospectors are permitted to enter the district.

Beggars on Fifth Avenue, Broadway, and other shopping thoroughfares of New York City often collect $50 a day.

Perfection of a process for vulcanization of rubber, under water instead of under steam, has been discovered by L. A. Laursen of Eau Claire, Wisconsin.

If a human being were to be completely covered with a coat of paint, he would die within five hours.

There were 3,081 West Point graduates who served in the army during the World War.

Cannibals of French Guinea are being hunted down by the French police. Six were executed in an effort to stamp out cannibalism.

Professor J. S. Hughes, of the Kansas State Agricultural College, has shown that violet ray treatments cause chickens to mature earlier and also make hens lay oftener.

A bill to prohibit Japanese from owning or leasing land in Kansas has been killed in the state senate.

The first cargo of hard molasses recently arrived in the United States in baskets from Java.

Four *cured* lepers have been released from the National Leprosarium, in Carville, Louisiana, after treatment which included the use of chaulmoogra oil.

The word "trumps" in card playing is derived from the French "carte de triomphe"—card of triumph.

Benjamin Franklin's mother-in-law thought twice before giving consent to her daughter's marriage with a printer. Her great objection was that there were already two printing presses in the United States and she doubted whether a third would find enough business.

The Bible passage which President Coolidge kissed as he took the oath at his inauguration was the first verse of the first chapter of the Gospel of John—"In the beginning was the Word, and the Word was with God, and the Word was God." The verse was Calvin Coolidge's first reading lesson as a child.

Bricks are produced in Great Britain by grinding the clinker and ashes and mixing them with lime and water.

The bond bootlegger has appeared. Bond houses located on the Illinois border take bonds into Indiana which have been approved by the Illinois state authorities but not by those of Indiana, make their sales and hurry back into their home offices in Illinois.

A special edition of Lord Curzon's favorite newspaper, with a bulletin announcing, "Lord Curzon's recovery certain," was made up and given to him by his physicians in the hope that the "good news" would help him.

From 300 to 500 dozen frogs or frog legs are shipped daily from Oshkosh, Wisconsin, during the summer season.

Motorists of the United States paid $80,000,000 in 1924 in a gasoline tax.

The London *Morning Post* is now being printed on paper made entirely of straw. The inventor is a Frenchman who uses only common salt and lime in the formula evolved for its manufacture. Thousands of straw stacks are burned annually in America to rid the land of the stacks.

New Jersey school teachers must read six verses daily aloud from the Old Testament.

Manufacturers of bookbinding cloth, to give the fabric body and stiffness, "load" it with fillers such as starch, flour, dextrin and casein, all good foods and pleasing to the palate of roaches which make blisters on the cover in eating the filling.

"I Read in the Papers—"

I read in the papers sporadic discussions about morality on the stage and in fiction, and the defense of the purveyors of rotten plays is always the same, they are doing it in the interest of art. It is somewhat surprising that no one has arisen to puncture the lie. The author of a degenerate book or play is himself a degenerate, always. Such writers and their books are to be judged by medical standards. No man or woman immerses his or her mind in ideas and scenes of sex and sin for periods ranging from six months to a year, in the preparation of book or play, who is not himself or herself mentally and morally degenerate. It just simply cannot be done. The normal mind may occasionally descend into hell, but to live there and to like it and to dub it "art" is diagnostically abnormal. So that it is not the books nor the plays that first call for examination, but the authors thereof. We need the presentation of reports on the authors by literary alienists competent to present the clinical findings.

I read in the papers that New York, so a publisher says, consumes less music per capita than any city in the United States. In "consumption" of sheet music, phonograph records, player rolls and of musical instruments, the home of jazz and syncopation ranks at the bottom of the pile.

Why?

Because there are no homes in New York.

A home, the publisher contends, is a residence where neighbors drop in for an evening and enjoy just being folks together—with a little homemade music on the side. In New York, home is a place for eating and sleeping; and social life merely starts from there, and goes elsewhere for the evening. If you would find the regions of highest density of real homes, consult the sales reports of musical concerns. Where the most music goes, there homes outnumber mere residences.

I read in the papers that Scandinavian telephone service is something for us Americans to dream about. In Denmark it is only necessary to notify the telephone company of your preferred time of rising in the morning; the operator, regularly at the stipulated hour, does the rest. By paying a definite fee, business firms of importance can be called by name, thus eliminating a great deal of thumbing of telephone directories. If you desire to go to the theater, you merely confide to the telephone company your wish. Immediately your desire is placed vocally in the ticket-buying line at the theater, armed with specific information regarding the location of your seat. If such requests arrive too voluminously, they are filed and filled in order of their arrival; and if the house is sold out in the meantime, the company obligingly notifies you at once, so that you may have ample time to make other arrangements for the evening. And, oh yes—if the line over which your call must go is busy, the operator does not rest with merely informing you of the fact. She continues, "—but I will call you." And unless you tell her not to mind, she will carry out her promise.

Even allowing for the margin of doubtful effectiveness that must exist between promise and performance, no one but a ticket scalper or an alarm clock salesman, I think, would locate the "something rotten in Denmark" in her telephone service.

I read in the papers that the Postal Telegraph Company will refuse to transmit any more race track news for betting purposes after the present contracts with race track gamblers have expired. This is cutting the knot that so many people have failed to untie. Horse racing may be defended, and even betting on the speed of horses in their presence at the track can be understood, but the national and international business of pandering to a gambling vice carried on in dark rooms and places of evil congregation, all in the noble name of well-bred horse flesh, is quite another thing. The bettors are so seldom as well-bred as the horses! In England this vice has reached such proportions as to rival the supereminence of the drink evil there. Bookies in England stand on street corners like newsboys and peddle their shilling bets. In America, many newspapers have campaigned against the evil and some legislators have passed laws prohibiting it. But as long as the telegraphic means were available, what effect could laws or editorials have? There are many evils whose virulence could be curbed by severing their connection with big business. The Postal will find that it has done a greatly appreciated act.

I read in the papers about a number of gentlemen whom I have never met but whose acquaintance is constantly thrust upon me. Mr. Shepherd, of Chicago, whom I have to breakfast with every morning and dine with every evening, whether or no. Mr. Chapman, of Hartford, Connecticut. Which gentlemen I name first, because they seem to bear racial names which one may use without being charged with making an invidious distinction. This column would not be long enough to include the other names thrust at us, and we may as well save Mr. Louis Marshall the embarrassment of mentioning his new interest in the Diamond murder case. Doubtless it is good journalistic service to inform us how the agencies of the law are progressing in their duties, and it is perhaps necessary to have a corner somewhere in the paper where the incidence of crime shall be disclosed, just as the prevalence of contagious diseases, or the condition of the weather. But why must we breakfast and dine with these matters? Are newspapers written, edited, and printed in the criminal courts? Is journalism merely a smart rewrite of the desk sergeant's blotter? It is not the news of crime that is objected to, but the crime of newspapers who think that it comprises all the news.

MR. FORD'S page this week deals with the attitude that has been assumed in certain quarters in regard to prohibition. The argument seems to be that if a law is violated it must be a bad law. The fallacy of this is the theme dwelt upon

---

HAVE you ever tried to dodge a university honorary degree? One might wonder why anyone should wish to avoid anything of this kind. But there are reasons, and in a brightly written article an honorary graduate tells his experiences in the matter of having "greatness thrust upon him." (p. 2)

NOW that spring is here the woodland songsters are once more making melody on every swaying bough. The birds are not only musicians but they are composers as well. Some of their masterpieces have been analyzed by an observer of nature, who also gives some charming drawings to illustrate his subject. (p. 3)

NOT very long ago the Right Honorable Montagu Norman, governor of the Bank of England, paid a visit to New York which created a flutter among financiers and others not directly connected with Wall Street. Just who Montagu Norman is, and what interest the Bank of England has in this country is an interesting story. (p. 4)

DOUGLAS FAIRBANKS is a name synonomous with the best that is in the movie world. In the course of a "straight talk" the screen star reveals some of the secrets of film art and its relation to the public. (p. 5)

THE days are approaching when people will be talking about going to the seaside and other places where a good holiday may be spent. The charm of the New England beaches in summer is the subject of a delightful series of word pictures, which are supplemented by several artistic drawings of coast scenery. (p. 6)

THE wi'es of the gasoline bootlegger, and the desirability of not signing sundry documents without an interview with your banker, are some things that it may be wise to become acquainted with, if you wish to save money and avoid sorrow. (p. 9)

THOSE who have been following the series of articles on the fate of Lincoln's assassins, and particularly J. Wilkes Booth, will find some hitherto unrevealed high lights this week. The sifting of conflicting evidence is by no means an easy task; but here it is, and the readers are asked to judge. This time the claims put forward regarding the identity of the house painter David E. George with the man who fired the fatal shot are thoroughly probed. (pp. 10 and 11)

THAT poison gas bomb which was dropped in the Rhode Island senate chamber last year has had an effect which the hirelings who dropped it never anticipated. Rhode Island is rejoicing in the passing of some much-needed legislation resulting from the co-operation of hitherto opposing forces. (p. 12)

This issue represents the last number of THE DEARBORN INDEPENDENT in its present form. Next week the magazine will appear in a handier shape and in an entirely new dress, which should prove attractive to our readers.

Can You Dodge University Degrees?

Something About High Cost of Having Greatness Thrust Upon You

By PUTNAM PHILLIPS

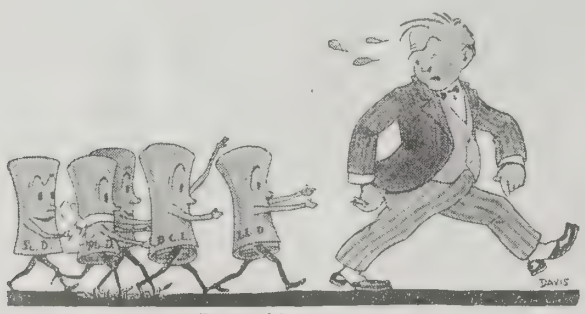
"YOU'RE a college man, aren't you? Now tell me something I want to know. How do you get rid of an honorary degree? How do you go about it? Do you resign? What do you resign from? I'm up against it."

"Get rid of an honorary degree? What do you mean—get rid of one? It isn't done. You just keep it; as far as I know, it is perfectly all right to have it put on the silver plate on your coffin. It will give the antiquaries who dig you up something to think about," I answered blithely. But my friend did not seem to care for my kind of wit. I did not quite see how he could be serious; but serious he was. He was really asking for information—confidential information.

But why about honorary academic degrees? For they were not in his line. I had known him for some years and the only interest he had ever taken in university education, to my knowledge, was to make fervent speeches on how little the university graduate who came to him for jobs knew. He was a self-educated man, who had left school when he was about thirteen and made his own way so well that he had some ten or twenty million dollars stowed away. I changed my line:

"Are you really serious? If you are, I will try to find out for you, but I am fairly certain that there are no precedents. I never heard of a man trying to get rid of a degree. It is too hard to get."

"Yes, you misunderstood me. I am serious. Outside



Pursued by greatness.

of my family, I don't believe anyone in New York knows it, but I am entitled to write myself down as 'Doctor of Laws' and also as 'Doctor of Civil Law'—that is, I am both an LL. D. and a D. C. L. By the official records I am a learned man—a book learned man. Of course, you know that is nonsense; what I know did not come out of books. But I am willing to let that pass; no one has to know about the degrees. But it has now come to such a pass that I can't afford to keep them. They cost me too much money."

"I am afraid that I still do not quite understand you," I interrupted. "I always thought that honorary degrees were given for merit and that they formed rather a neat way of complimenting a man for what he had achieved."

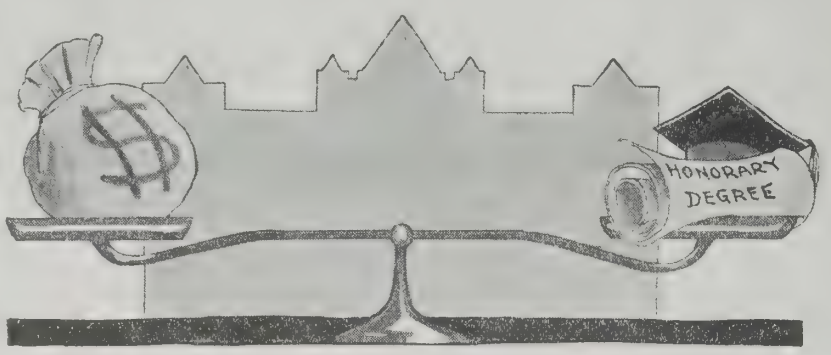
"That was just what I thought once upon a time," he answered bitterly, "but I know better now. It was this way. Five or six years ago, when I was just beginning to be known a little, a clerical looking gentleman announced himself at my office as the president of what we shall call the Simpkins University. I had never heard of the place, but I saw him. He was most dignified and courteous. He said that the trustees of his university had discussed the matter of recognizing my outstanding achievements by bestowing upon me the degree of Doctor of Laws at their next commencement, but that before taking formal action he had been asked to discover if I would accept the honor.

"Of course I accepted. I was really touched to think that in this secluded seat of learning the real import of my service to humanity had been recognized. When he had gone I looked up the university; it was not large and it was a long distance away, but it was thoroughly respectable. It flattered me to know that the academic cloisters knew all about me.

"In due season I got a formal letter advising me of the action of the trustees. It was a great day—that commencement. I did not know about having to wear a cap and gown but the college authorities loaned me one to appear on the platform—it was an open-air commencement. I listened to a long oration that must have been about something, but I don't remember what, and then came the awarding of the honorary degrees ahead of the bachelor's degrees to the students—the baccalaureate degrees, I believe they are called. I learned all the patter at the time. Four of us were presented for degrees; a bearded graduate read something in Latin, which I afterward found out enumerated the virtues that gained me the degree, a college official hung a big silk sack, which they call a hood, about my neck; the students cheered—and I was an LL. D. Afterward I made a speech at the alumni dinner—I was an alumnus of dear old Simpkins!

"And then the president made an impassioned appeal for money to carry on the work of building a new science hall. I felt that the work of such a noble institution should not halt for funds and before we had finished I had simply forced ten thousand dollars on the president.

"The next year another university awoke to my merits—call it the Pussy Willow University. Well, the formula was just the same and the end was just the same, excepting that I got a D. C. L. In my enthusiasm as a Pussy Willow alumnus, I also gave ten thousand dollars.



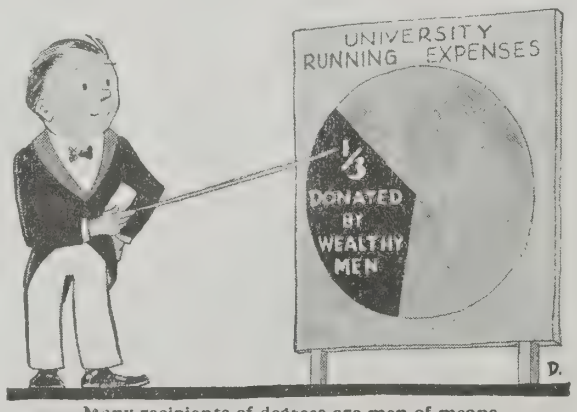
Are honorary degrees always given for merit?

"Where I made my mistake was in shooting so high. For each year since then, those dear old, scholarly presidents or some equally dear old, scholarly colleagues have found urgent need for large sums and I have never got off for less than ten thousand dollars each. Now the novelty of being a real alumnus is wearing thin. But as long as I have those degrees I cannot in decency refuse to contribute. What am I going to do?"

I thought the case of my friend was exceptional. He was known to be free with his money and I took for granted that both degrees had in the first place been innocently enough given and that my friend had really by his manner encouraged the demands on him. Then I began to investigate a little—to look over the lists of honorary degrees granted. A majority of the recipients were more or less distinguished for learning, for public service, or something, and, recognizing the impossibility of setting up standards as to what constitutes a distinguished man, at least a passable argument might be put up for most of the men honored.

But in almost every list I discovered a few men I either did not know or knew only as possessing money. The unknowns invariably turned out to be local characters of superlatively good credit rating. All of the lists were, insofar as I could discover, perfectly respectable—that is to say, if any of the people had done anything they shouldn't do, they had not been caught at it.

College degrees, it may be said in passing, are of most ancient origin. In the Middle Ages, when education was wholly controlled by the church, the license to teach was regulated on somewhat the same lines as the license to preach. Teaching was then, and to some extent still is, a jealously guarded profession. The primary qualification for teaching has never been so much the real



Many recipients of degrees are men of means.

knowledge of the candidate as the conformity of his knowledge with the opinions of his superiors. In the old days when books were few and expensive, a man was considered duly educated if he could carry the contents of a certain number of books in his head. Memory and not the ability to think is still the formal test of education. Properly speaking, books are only tools for the mind to work with, but the formal tests of education are still back in the Middle Ages.

A man with a verbatim memory is not apt to think much—for he has always at hand an apt quotation which will bat for a thought. Men who do not think easily get conceited. And so, from the beginning of time, men who have memorized things have tended to set themselves apart as learned. They have dressed themselves in caps and gowns and awarded themselves titles or degrees, that no man might omit to notice that they were learned. At first all the degrees were earned—that is, awarded after exhaustive examination. But sometimes the universities needed the help and protection of princes whose swords were mightier than their pens. So the princes were flattered with academic honors—of course, without the bother of examination. Other lusty princes, liking to share in any honors going, demanded degrees—and got them. And thus arose the practice of having two classes of degrees—the earned and the honorary.

The earned degrees are of three grades—the baccalaureate degree, such as Bachelor of Arts or Bachelor of Science, which is awarded after a course of undergraduate study; the Master's degree, which represents an amount of graduate study; and the Doctor's degree, which represents a still greater amount. In this country we got into the habit of giving the graduate degree of Doctor on completion of a bachelor's course in medicine—our M. D.'s are not doctors at all, they are only bachelors of medicine. The honorary degrees are all doctorates and those most frequently granted are Doctor of Laws (LL. D.), Doctor of Civil Law (D. C L.), which are really general degrees and may or may not have anything to do with the recipient's knowledge of the law, Doctor of Science (Sc. D.), which is given for various reasons, and Doctor of Divinity (D. D.), awarded to clergymen. There are hosts of other degrees. The highest of the earned degrees is Doctor of Philosophy (Ph. D.), which is the favorite German degree; our education has been so strongly influenced by German methods that it is practically impossible nowadays to obtain any kind of a collegiate appointment without a Ph. D.—following the German practice.

But, to get back to the honorary degrees. I sought someone to tell me why and how our universities bestow their academic honors. At last I found a man who for more than thirty years has been intimately in touch with collegiate affairs. I told him the case of my friend. He laughed heartily:

"Where have you been living all this time, and how do you suppose universities get their endowments, not to speak of their running expenses? Where do you suppose these buildings and stadiums come from? A university president today has to be a business man. Of course it doesn't do any harm for him to know something about education, but that is not at all essential. He can hire people to look after that detail; also he can hire someone as an administrator. An ideal university head of today ought to have the intuitions and persuasiveness of a fake stock salesman, the judgment of a bank cashier, the sharpness of a building contractor, and the ingenuity of a circus press agent. For making ends meet is no easy job.

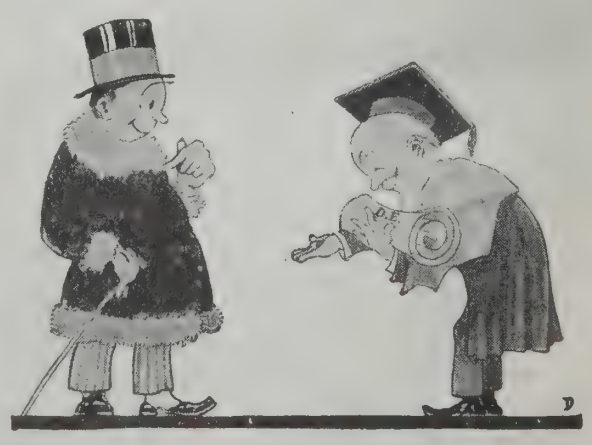
"Since the war, universities have been up against it. Their expenses have increased tremendously and it has not been possible greatly to raise tuition fees. Anyway, a university rarely derives more than a quarter of its income from tuition fees. About one-third of the running expenses, in other than state-supported institutions, comes from endowments or current contributions from wealthy men.

"So our university heads have simply had to take lessons in financial eugenics. The kaiser was the first man to realize the real value of decorations; he concocted no end of them—and distributed them with rare skill. That is one of the ways he made such a compact unit out of the German Empire. Lloyd George, as is well known, distributed baronetcies and even earldoms with a lavish hand. We Americans are short on titles. Everybody is a 'Mr.' or an 'Esq.' nowadays, while 'Hon.' is also getting pretty common. Of course, being a democratic nation, we care nothing at all about titles or honors—no more than we do about our right hands. Fraternal societies flourish principally because of the sonorous titles they make up for their officers.

"The universities had been doddering along for years giving their honorary degrees to professors, clergymen, and whoever they really thought to be distinguished. Say what you will about their judgment, their motives were right enough. Degrees are prized; they have a commercial value for professors and clergymen and a sentimental value for business men and financiers. It is very proper to give recognition to business men—for it is they who make the country. Also they make most of the universities possible.

"And so now we have this whole matter of honorary degrees on a practical basis. We give our professors honorary degrees instead of raising their salaries; we will give the professor of English in X University a degree on the tacit understanding that X will give our professor of English one and thus both of us will get some advertising; we give degrees to prominent men, if we can get them, whose names will help advertise us; we give a degree to the governor or the mayor if we need him on a pending bill; we give degrees for pure merit and then we give degrees to a few men—just a few, mind you—who are warranted by what we might call our credit committee to have the money—and to be willing to come across with it.

"A scandal? Not at all. Just the application of business principles to education. It will not last forever, though. Some university is sure to get too raw. Still we may get frank and invent a new degree, say 'D. E.'—Doctor of Endowments."



We may invent a new degree, "D. E."—Doctor of Endowments.

Singers of the Woodlands

Some Characteristics of Our Feathered Friends

By S. F. AARON

Illustrated by the author.

The singing attitude of the Ovenbird.

GENERALIZATION is a custom or habit in nature study and the keeping of its records; merely casual observation of the characteristics of species rather than individuals gives evidence of hit-or-miss methods that are amateurish. Such observation is one thing; earnest investigation quite another.

There seems to be a general impression among naturalists that the individuals of one species come entirely under the same laws and a writer has stated that the habits of a bird are precisely indicative of those of its kind. Seton very wisely adopted the idea of studying an individual animal, but incorrectly inferred that by so doing clear insight of its species can be had. Error has arisen through this method, for with all of the higher vertebrates and those invertebrates of the most complex habits there is individuality of a decided character shown.

No two bobcats, weasels, nor even woodchucks act precisely the same under similar circumstances; no two digger wasps, carpenter bees, nor even swallowtailed butterflies conform to the same set rules of conduct, and there are no species of birds the individuals of which do not differ considerably if we but look closely into their comings and goings and listen with a discriminative ear to their vocal efforts.

Beyond question wild creatures possess more specific habits than individual traits and this may even be said of that animal with the highest mental development, but what kind of a biographical history of mankind would it be that generally bunched the living customs and mental traits of Henry David Thoreau, Cornelius Vanderbilt, and John L. Sullivan?

I have watched the nest building of several pairs of orchard orioles. One male absented himself almost entirely during the actual construction; another fetched a little nesting material; a third tried to weave some grass stems into the pendent bag, but was chased away; a fourth perched directly above the nest, or fluttered about over it, uttering little half-songs the while—these may have been intended as encouragement or suggestions, but were probably only boastful satisfaction; at least he was not driven off.

I have known a male barn swallow in late summer to avoid with ease and grace the swoop of a sharp-shinned hawk and another, at nearly the same time of year, to fly at, attack and follow, with the persistence of the purple martin, a hawk of this kind. I have watched two great blue herons fishing, or tadpoling, within a few yards of each other. One struck from a nearly erect position without a preliminary indication of its purpose; the other lowered its neck and body very slowly, bending forward and then made the usual javelin thrust of its long bill.

So might be recorded almost without end the individually distinct peculiarities of all birds. Alexander Wilson observed a mother ruffed grouse, with but one baby bird, turn suddenly after the usual and futile effort to confuse the supposed enemy and seizing the chick in her bill fly away down the mountain side. This story might be readily doubted and would be if Audubon had related it, but the first biographer of American birds has a deserved reputation for accuracy. It is very certain that grouse rarely resort to this method of protection when they have a large brood. The usual way is to dodge about and sometimes boldly to attack the trespasser. I remember one such bird that took to wing immediately with nothing in her bill, deserting for the time her well-hidden offspring.

It is by the notes and songs of birds that their individuality may be established and also by their half-enforced or coaxed association with man. Taken together they offer evidence that explains much not hitherto recorded.

Hardly any two birds of the more elaborate singers follow the same vocal sequence. The more varied the song, the greater the variation between the individuals. Broad and fixed similarities permit the entire effort to be unmistakably recognized as emanating from a certain species and even the pitch, tone, and inflection of separate notes will clearly indicate the identity of the singer. Thus the first utterances of a wood thrush, a hermit, veery or olive-backed thrush are indicative and it does not take a very keenly attuned ear to recognize the mocking bird, thrasher or catbird, one from the other, at the very beginning of song. Though somewhat alike, sequence and tone more than inflection serve to identify

The Red-eyed Vireo, or Greenlet. Often called the "preacher bird," because of the deliberate repetition of its notes, uttered in groups of two and four with pauses between.

the ditties of the song and vesper sparrows; the songs of other small finches that have many notes, as the indigo bird, the junco, the goldfinch, and the fox sparrow, are principally different in sequence, having also separate notes that are specifically distinct and identifying.

Almost at any time a song sparrow may be heard whose song departs widely from the usual carol. It is most common for these birds to start off with two or three notes alike, but some may have four or five. I have heard a song sparrow that started with a trill of perhaps a dozen notes and finished with the same, the latter a most unusual performance. At another time, attracted by a strange and new song and half identifying it as that of a purple finch the full notes of which somewhat resemble the warbling vireo, I found the strangely gifted singer to be a song sparrow and, stranger still, after this superior melody was repeated many times, the bird suddenly changed position in the bush and sang a ditty that apparently did not vary from the most usual song sparrow notes.

The Hairy Woodpecker. The species, though not the same individuals, is with us in every locality throughout the year in the Eastern and Central United States and Canada.

The vireos or greenlets possess certain class or group distinctions in their songs which may principally be told apart by sequence; the inflections are very similar, especially between the red-eyed and warbling vireos. The efforts of the former are a sort of irregular conglomeration of notes, the latter less mixed, therefore more musical and nearly always ending in a rising inflection. But I have heard it without this ending. It is sometimes difficult to tell a solitary vireo's song from that of the red-eye; other individuals possess a peculiar ending note that is at once apparent as belonging to the species. There is more individual variation in the songs of the red-eyed vireo than in any of the others, though because of the deliberate and monotonous utterance this is more difficult to recognize.

This variation in the songs of individual birds is not so uncommon as the casual observer may suppose; it is well known that several species, notably the ovenbird, the Maryland yellowthroat which is common all over the Eastern United States, the orchard oriole, and the towhee or chewink, utter impromptu bursts of music, especially during periods of rivalry when mating, or sometimes at night when disturbed. These efforts are altogether different in every way from the usual songs, at least in the beginnings, though the endings may include the common notes.

Variations in bird notes are also common among the species of wood warblers. The best singer of the group, though with less complicated notes than the chat, is the hooded warbler, of generally southern habitat, though it reaches the northern states in the breeding season. Three of the most forceful singers of this family, with notes greatly resembling each other, are the ovenbird, Maryland yellowthroat, and Kentucky warbler, the latter also of rather wide habitat. Not only do they possess variable characteristics between individuals, but there are restricted racial variations most distinctly discernible with the ovenbird and the hooded warbler.

Burroughs described the ovenbird's song by the syllables Tea-cher, *Tea*-cher, TEA-cher, *TEA*-cher and in his home section of Eastern New York and all through New England this is a correct version. Somewhat south of that, without a discernible definite line, but including Northern New Jersey and Pennsylvania, the accentuation is reversed. These birds sing: Tea-cher, Tea-*cher*, Tea-CHER, Tea-*CHER*, the last syllable plainly the louder. In Southeastern Pennsylvania, Maryland, Southern New Jersey, and the mountains as far south as Tennessee the song is again varied, having no accentuated syllables whatever, but merely growing louder with each repeated utterance, as: Tweet-so, *Tweet-so*, TWEET-SO, *TWEET-SO*. This is almost universal; here and there during the nesting season, but only in the more southern sections of its habitat, will be heard songs that resemble the racial types of other localities. Also, during the migrations northward, these variously accented songs may be occasionally heard and one might correctly pick out those birds that later reach the northern and central regions, for they are generally to be heard before those with unaccented songs.

The hooded warbler ranging north of Virginia to the southern and central mountains of Pennsylvania

The singing attitude of the Hooded Warbler. This bright yellow and yellow olive bird, with its cape of black, is a lover of the tree tops as well as the lowly thickets.

possesses a song so different from its species breeding within the wide mountain and valley area of the southern Appalachians that the former may hardly be recognized by an observer familiar with the other. There are more syllables in the song of the northern bird, with also a distinctly accented beginning. This also indicates racial characteristics and it would be interesting to trace the demarkation or connecting links between the two, the writer having found no opportunity therefor. The well-known song of the Maryland yellowthroat is a sweet-toned Weet-sit-so, Weet-sit-so, generally uttered four times together. In Missouri and Southern Illinois I have heard this bird utter its song without the middle syllable and this again may indicate racial variation.

Now, the foregoing facts may seem quite trivial did they not indicate certain conditions and habits that are of interest. Birds return year after year to their old nesting localities, often to the very group of trees, the clumps of bushes, the grassy hillsides. But the young

Montagu C. Norman–Man of Mystery

The Sphinx of Finance Who Watches Over the Bank of England

By MAURICE MANNING

"THE Man of Mystery" is the name now generally accorded to the Right Honorable Montagu Collet Norman, P. C., D. S. O. and (what is more than all the rest) governor of the Bank of England. After his return from Washington where he was the guest of the head of the Federal Reserve Board, there was much speculation as to the object of his visit.

Although an American on his mother's side, the governor of the Bank of England is Oriental through and through and "mystery" forms large part of the Oriental's stock in trade. He is probably the most secretive man in English public life today. Although the administrative head of the leading financial institution in the world, and one that has been regarded as typical of British frankness and honesty, he can hardly be said to be in "public" life at all. Within his sanctorum at the bank, closely guarded by a series of doorkeepers and secretaries, he lives almost as secluded as in his out-of-the-way home in Kensington. Typically oriental again, this house is of unpretentious exterior,

Bank of England from the Mansion House, showing part of front of Royal Exchange and the Wellington Statue.

but furnished and adorned within with art treasures and especially oriental rugs, hangings, screens of carved teak and ivory and silver and gold embroideries of enormous value and in great profusion.

For that matter, the bank (Colossus of Bank, it is!) has always been more or less of a mystery. Under its charter, it is excepted from the requirements laid on other banks of publishing annual reports of its earnings, assets, and liabilities, although under its monopoly in England of the right to issue circulating notes it publishes the amount of these notes issued and the reserve in bullion held to secure them. While acting as the financial agent of the government, it is really a private company with no direct representative of the government on its board. Besides government deposits, it handles the enormous deposits of the great joint-stock banks—practically all the banks in England. Its discount rate fixes the interest rate for banking accommodation the country over. And since Montagu Norman came to the front as governor some twelve years ago, the bank has been a more mysterious concern than ever. He is, by the bye, the youngest man to have held this commanding position, and through the exigencies of the Great War, and the almost as trying exigencies of the pseudo-peace, he has proved himself the ablest of all the Bank of England's governors.

Avoids Fierce Light That Beats Upon a Throne

He is a connection of the Montagu family, of which the late Edwin S. Montagu, for a time Secretary for India in the Coalition government, was a conspicuous member and of which the present Lord Swaythling is the head. His father was for a long time connected with the great banking house of Sassoon & Company, the representatives of the Rothschilds in India and at Hongkong, as the New York house of August Belmont was and is its American representatives. This may seem to indicate that Mr. Norman's rapid rise in the Bank of England was not unconnected with the Rothschild influence. While it is well understood that this influence dominates the Bank of England, as it dominates the Bank of France and many of the big Wall Street banks, it would be a great mistake to imagine that Montagu Norman had won his way to the front—and incidentally won the complete confidence of the House of Rothschild—by any other avenue than that of sheer ability, untiring industry and exceptional talent amounting to genius as a banker and administrator.

With all this, Mr. Norman is a man of remarkable modesty. He prefers the role of a Warwick to that of a wielder of the scepter. He avoids the fierce light that beats upon a throne. He is characteristically Oriental in his preference for the indirect method of announcing to the public what he wants the public to know, or to think it knows. So those inclined to read between the lines find strong evidences of Mr. Norman's "inspiration" in certain financial utterances of the financial editors of several of London's morning and evening papers, as in the weeklies. Similarly inspired, it is believed, are nearly all the long speeches of the chairmen of the great joint stock banks at the various annual meetings that have been held within the past week or two. In every case, with remarkable unanimity, these speeches have stressed the necessity of a speedy return to the gold standard as a means of stabilizing the value of the pound sterling, and so restoring international trade. Several of these big bank heads went so far as to urge special legislation to bring about an earlier revocation of the prohibition of gold exports which expires automatically at the end of the present year. Others pointed out that a continuance of the increase in dollar value which recently touched $4.80, or within threepence of the so-called normal or par value, would soon settle the whole question.

As a matter of actual fact, the market value of gold bullion is now, and has been for several years past, at a premium over the pre-war value of that metal. To put either dollars or pounds sterling on a "gold basis" would be equivalent to increasing the weight of the gold dollar and the gold sovereign about 8 per cent. It is not that either British or American paper circulating medium is at a discount, but that gold has *increased* in value in recent years, so that it now commands a premium as compared with pre-war values. And it is by basing our currency standards on the very variable and fluctuating prices of this metallic commodity that the wiseacres talk about "stabilizing" the currency!

The question of a return to the gold basis is at the moment the commanding topic in financial and commercial circles in Britain. It has been sedulously and elaborately stage-managed into the limelight in the public mind. "Get back to gold!" as the only way to safety from national bankruptcy and trade disaster, is the cry that has been suddenly raised, and it is iterated with all the emphasis of metaphorical megaphones and loud-speakers in the *press*.

Reginald McKenna, former Chancellor of the Exchequer and now chairman of the Midland Bank, perhaps the most important of the "Big Five," frankly recognized the place filled by psychology in the whole matter. Seemingly, he is personally under no delusion as to the alleged connection between gold and safety or stability. He said: "One of the greatest advantages of the gold standard is its moral effect. A nation will think better of itself—will almost regard itself as more honest—if its currency is convertible into gold."

While this argument is based on psychological rather than economic grounds, Mr. McKenna contends that it is none the less powerful on that account. He, indeed, goes so far as to advance the striking proposition that "so long as nine people out of ten in every country think the gold standard is the best, IT IS THE BEST!" Plainly this is an argument that cuts both ways. If nine people out of ten come to see that a currency based on real wealth of every description, and properly managed as to volume of issue, is the best and safest currency, *it will be the best and safest currency!*

Most of the financial writers agree that Mr. Norman, during his brief visit to the United States, "has done a very great service to England." Mr. Norman's hurried and mysterious trip would have been worth while from the English standpoint if it had merely succeeded in running up the value of the pound and running down the value of the dollar temporarily, but long enough to save the British Exchequer 10 cents on the pound on the payment of the last installment of £25,000,000 on her debt to America.

In this connection, British writers point to "the eagerness shown by the United States Post Office to help in the work of restoring complete parity by already putting up the price of American money orders on England to par." Very pretty behavior this from the English standpoint! How does it look viewed from the standpoint of American interests? Sterling in the exchange market has already sagged from the high water mark of 4.8075 touched on January 23, to 4.7575, somewhat to the dampening of the expectations of an early return to the gold standard which we have been discussing. So thousands of United States citizens making small remittances out of their savings to help relatives left behind in Britain, or to pay for small purchases of one sort or another, will have to pay Uncle Sam $4.8675 for every pound sterling, or 11 cents more on each pound than the amount for which they could today buy the same exchange from the bank across the way or next door. To the extent that the buyers of these money orders keep track of the actual rates of exchange and that their business is worth while, it means driving profitable business away from the United States Post Office counters to the banks. Insofar as it concerns those seeking the money orders, and trustfully relying on the fairness and honesty of a great nation, who give their business to the post office, they will be flimflammed out of eleven cents on every pound they buy at the false and artificial rate demanded. I wonder if the English Post Office, in selling money orders on American cities, follows the example set by the American Post Office Department and forks up eleven cents more than the actual value in American money of the pound sterling?

As to the actual distribution of the world's gold stock, Frederick C. Goodenough, chairman of Barclay's Bank, provided some interesting information. He estimated the total amount of gold now held in England at £155,000,000. That represents about one-half the total quoted for the United States. As the population of England is less than one-half that of the United States, England has actually more gold *per capita* of the population than has the United States, whose citizens are represented as complaining that they have too much! Twenty years ago the gold coin and bullion in the Bank of England was roughly estimated at £35,000,000; last week it was nearly £127,000,000, and there is a considerable quantity of gold held by the private and joint-stock banks. This shows that there has been a gradual but steady accumulation in London of the yellow metal.

Britain's Return to the Gold Basis

In view of the fact that the whole trend of these official utterances of the spokesmen of the banks seems to have undergone a vast change from what it was a year ago, the question arises, What is behind the apparent transformation of mind? At the 1924 meetings, the bank chairman, for the most part, showed considerable fear of the deflation which might result from a return to the gold basis. In fact, several of them declared that what the country needed was an expansion in the volume of the currency.

Now it appears from a comparison of the "inspired" utterances of the proxies of the astute Mr. Norman that a plan is envisaged that will combine the objects of inflation to meet the urgent needs of business with a restoration of the gold basis in England, its retention in the United States and its gradual extension to all Europe and the East. Here is the proposed formula in condensed form: "In accordance with the report three years ago of the Cunliffe Committee and with the unanimous opinion of bankers and financial experts today, we must get back to gold forthwith. Delay is dangerous. The way to resume is to resume. Within three or four months, we must reduce our legal tender to £155,000,000, that is, to the amount of gold in the coffers of the Bank of England and the Treasury Note Reserve. And we must do what is necessary not so much to keep the £155,000,000 in the country as to insure that as fast as it may go out *more* will come in."

This will remind Americans of the terrific crisis that was precipitated in the United States when a concerted deflation of the volume of the currency and a drastic curtailment of bank credits robbed the farmers of some $400,000,000 of the value of their wheat, corn, and cotton crops and increased the value of their mortgage indebtedness (measured in purchasing power) so that there was a great swathe of foreclosed farms and homes throughout the agricultural sections. But Mr. Norman's genius had not then blossomed. Now we are told, paradoxically enough, that this severe deflation of the volume of legal tender will be followed by "*funds, cheap funds, and plenty of them!*"

It sounds like a cross-word puzzle. What is the solution?

Well, it's quite easy. The people of Britain, following the reduction of legal tender currency to the actual metal value of the gold in its bank coffers, must simply "increase in very marked degree the purchasing power and the earning power of gold in Great Britain." To this end, they must make a drastic cut in the costs of production and the selling prices of commodities; "but not in the price of labor, which must increase in real wages at least—though its percentage ratio to production will be averaged down."

Douglas Fairbanks' "Straight Talk"

Movie Star Reveals Some Intimate Secrets of the Screen Art

By JOHN ANSON FORD

IN CONVERSATION Douglas Fairbanks comes right back at you thrusting skillfully just as he does in fencing and even when one's questions become pointed he does not lose his good nature. Sometimes he parries, as every public man must do on occasion, and again he "tells you straight," just what you want to know. The interviewer is made to feel that he is seeing the man as he is. Always he is interesting, stimulating, aggressive.

In two minutes after we had left the grass plot on the Pickford-Fairbanks "lot" in West Hollywood, where Doug had been playing a strenuous game of pelota—an ancient Basque game, as he explained—we had plunged into manifold considerations affecting the making of pictures. Why are certain types of pictures produced? Why are they popular? Who's who and what's what? And so on. I soon discovered, as I shall indicate presently, that this hero of millions of movie goers has very definite ideas about "what the people want."

The suite into which Doug led the way at the end of a long low office building was itself an index to the character and work of the man. First we entered a combination reception room and dressing room. On the walls were blue print charts showing schedules of studio work for months in advance—evidence of system such as is not found in the make-up of every artist. In one corner was a scales emphasizing the important part which physical condition plays in this actor's scheme of things. A half-opened door revealed a plunge. In another corner was complete make-up equipment, a masculine boudoir as it were—a barber's chair, large wall mirror, a bewildering array of grease paints, creams and what not. On the left was a spacious closet filled with an array of costumes (chiefly Spanish in design, since a Spanish picture was occupying the studio), shoes to the number of a dozen pairs and as many different kinds of hats.

Beyond this larger room we entered a little private retreat furnished with a polished walnut table, a couch, and two chairs. On the walls hung two handsomely framed photographs, one of Mary and the other of Doug. The windows were partly darkened by heavy yellow hangings with blue figures. There was something restful about the spot and it was so small that folks could not follow Mr. Fairbanks here if they would. I fancy that it is a welcome resting place for him at the end of many a strenuous day.

Immediately our conversation got under way, I was interested to discover that this versatile man is a real philosopher. One might assume from the fact that his pictures are merely entertaining, that his thinking is confined to the so-called lighter vein. Nothing could be further from the truth. No subject is too profound, no problem too baffling for his mind to grapple with. Not that he expects to get a final answer in every case, but he takes real zest in trying to solve the great mysteries of life.

"Your Mr. Larkin said to me a few moments ago that he doubted if you, or anyone else, really know what the people want in pictures. He says you all are guessing," I commented.

The remark set Fairbanks to thinking for a moment and a sort of Zoroastrian scowl flitted across his face. Then his right fist smacked down hard into his left palm.

"This much I do know. The public wants 100 per cent of 'you.' I mean 100 per cent of the man or woman making the picture."

With characteristic speed the man's mind became dominated by this idea for the moment. He moved to the edge of his chair and with emphatic gestures that reminded me of Roosevelt, he enlarged on this thought.

"One must give himself to his 'picture' utterly and completely—his sweat, his muscle, his tissue, his brain and thought. Now then"—and a swarthy hand shot toward me—"*if you are normal* in body, mind, and heart you will produce something that will appeal to the people. For remember, the majority of the men, women, and children are normal, well-rounded beings. Some may be more developed and cultured than others but as far as they go most people are normal.

"But if you are narrow, if you are underdeveloped in any phase of your personality—body, mind or heart—you will produce something correspondingly defective. When you are producing for the screen you really can't camouflage, you can't cover up, you can't hide your own character. Now that sounds a bit strange doesn't it, in a profession which has so much make-believe in it. But you see what I mean. A picture, or a series of pictures, will sooner or later reveal the true character of those who share in their creation."

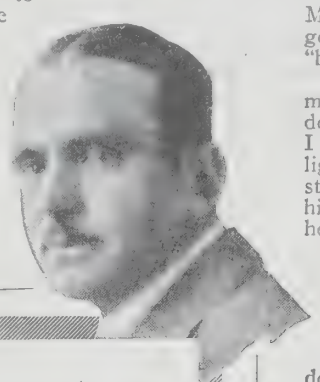
"Well, then," I countered, "how do you account for the surprising number of salacious, tawdry films on the screen today? My little family had an example of it just the other evening when I fulfilled a promise to our young son to give him a 'movie' treat. The program started off fine with a fairly decent comedy, though heaven knows, I did not see a great deal of humor in the picture. Then came the *pièce de résistance*—a cheap conglomeration of gaudy clothes, a 'strip' poker party, a giddy, tipsy house party—all under the guise of teaching a moral lesson. The youngster was wide-eyed with amazement but I was mighty thankful that he was too young to catch the innuendoes or to interpret the compromising situations presented."

Doug was silent for a time. I had put him in a corner, for he is reluctant to criticize others in his profession. Furthermore, he admitted that he had seen the picture to which I referred.

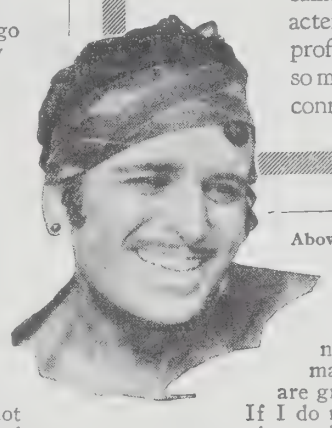
"Narrow-chested, narrow-minded," he snapped and his white teeth clicked together. "It's as I was telling you. Some folks are underdeveloped. Then, too, others are the victims of a surplus energy. You know, everybody should keep worked down to fighting trim. If you loll around without any real work to consume your energy you are going to get a perverted view of life. Pictures conceived and produced by people of that type necessarily reflect their makers. I tell you it is one of the finest things in the world to keep fit. It keeps one out of a lot of trouble."

He reached across the table and picked up a wax doll, fashioned and costumed to represent the "Thief of Bagdad," and set the figure to dancing merrily, a laughable reminder of Doug's own Bagdadian pep.

"Now it seems to me," he resumed, "that some producers try mechanically to concoct a picture by combining so much of this with so much of that, and when they have finished they wonder why it has not been a winner. I do not believe great pictures are made that way any more than are great books or great paintings. If I do not put my whole self into a picture it is not going to have the qualities that make for success."



"The public wants 100 per cent of the man or woman making each motion picture," says Douglas Fairbanks. "One must give himself to his picture utterly and completely—his sweat, his muscle, his tissue, his brain, and thought. If you are normal in body, mind, and heart, you will produce something that will appeal to the people, because the majority of men, women, and children are normal beings. If you are underdeveloped in body, mind or heart, you will produce something correspondingly defective. When you are producing for the screen, you can't camouflage your character, even in this profession which has so much make-believe connected with it."



Above—DOUGLAS FAIRBANKS.
Left—Douglas Fairbanks in "The Thief of Bagdad."

With that he brought his fist down on the corner of the table and the doll clogged excitedly.

"As a matter of fact I do not spend a great deal of time asking 'What do the people want?' or 'What will the people think?' because in a sense, I know what they want, already. They want one's thought, one's energy, *one's self*. And that applies to every actor. We can't 'hold out' on the public for long or they will detect it in our efforts before the camera."

As he paused and pulled at his mustache his mind was working by leaps and bounds, just as his body works when he gets into action.

"In one respect I do take people's opinions into account. When I am searching for a central theme for a new picture I select something which has stood the test of time—not merely something which is popular today but an idea or a principle which many generations of people have accepted as fundamental. In 'The Thief of Bagdad,' for example, it was the idea that 'happiness must be earned.' The whole world knows that unearned happiness is not happiness at all."

Whether Mr. Fairbanks was thinking it, or not, I do not know, but it occurred to me that many a trashy picture in the screen today has "fallen down" because it did not ring true to life either in its alleged happy ending, or in some other particular.

"Or take the picture I am working on now," Doug went on. "We call it 'Don Q' and it is the story of a youth that was terribly wronged. The central theme is nothing more nor less than the old saying 'Truth crushed to earth will rise again,' and I have added 'if you have the yeast to make it rise!'"

The more I thought of that phrase the more I realized that Mr. Fairbanks had said something characteristic of his own success in pictures, as well as the success of every other really good cinema actor. The pictures which the people like, the entertainments which the public wants on the screen are those that are true by reason of the sincerity of the actors and writers. But in addition to this genuineness there must be a vital something, a touch of genius which lifts them out of the commonplace without lifting them out of the common reach. This is the "yeast" that is found in all truly popular pictures.

A few days after this interesting conversation with the creator of Robin Hood and other screen characters now universally beloved, I accepted his invitation to go to the studio again and see more of "Don Q" in the making.

"I fancy I have impressed you as a 'long speaker,' Mr. Fairbanks had said laughing, when I bade him goodby at the close of the conversation just recorded, "but come again and you may get a different impression."

While I have been on this and other lots a good many times the scene presented always proves tremendously interesting, but on this occasion particularly so for I had had an opportunity to see this premier actor in a light different from that given to most spectators at the studio. Mr. Fairbanks had spoken about himself and his outlook in a manner that few have been privileged to hear. So on this latter visit it was most interesting to see the man practicing what he had been preaching.

It was a typical "lot" setting with remnants of Robin Hood's castle towering high in the offing and nearer at hand minarets of Bagdad and mullioned windows from Haddon Hall. High on the tops of the set where "Don Q" was being created were a dozen men with huge reflectors lighting up a courtyard below. From my vantage point behind the cameras this quadrangle had every aspect of realism. Climbing roses, fresh and fragrant, covered the walls. The flagstones, whether of plaster or cement, appeared to have been worn smooth by the feet of countless generations. The black wrought-iron gate, with its huge key dangling from the knob, gave no hint of its wood-and-scroll-saw origin.

But Doug was oblivious of his surroundings. He was paying court to a fair damsel beneath the sweet-scented roses, while an orchestra of real Spaniards, just out of range of the cameras and batteries of lights, gave forth tones reminiscent of old Madrid. Over and over again with unflagging intensity, under the critical observation of the director, Mr. Crisp and a galaxy of camp-chair associates, this couple went through the scene until the customary "O. K." was affixed to the end of the film.

Unless one is familiar with the pains taken by Mr. Fairbanks and other actors of standing, one has no conception of the real hardihood and patience, plus sustained enthusiasm, necessary to produce a really great picture. Every step, every gesture, every change of expression is the object of painstaking examination and merciless criticism. There is no royal road to the production of good pictures.

But as time wore on it was manifest that progress was being made. Scenes were being shot one after the other with the utmost care. Whether before the camera, or at the side of his director, who incidentally takes a leading part in the play as well, Mr. Fairbanks' presence was always felt. Unobtrusively he kept the company intently and earnestly at the task, although he seemed utterly oblivious of everything but the story of the young Spanish nobleman who had been grievously wronged.

In commenting on the strain and responsibility which he takes on himself when he sets out to produce a new picture such as "the people want," Doug made a confession.

"We must have enthusiasm in what we do," he explained. "I just naturally throw myself into the picture without reserve. Everybody catches the spirit of the thing and we grind out scene after scene. Then all of a sudden I find myself 'going dead.' And I ask, 'What is life all about anyway? What is the use of all this sweat and worry?' Do you know, I can't make myself feel that I have a great solemn mission to perform in the world. But I do feel that each day I must do my bit decently, honestly, and enthusiastically. When I go 'flat,' as I was telling you, I just turn my thought to today's job and my pep returns. I stop trying to figure out the ultimate meaning of existence and content myself with doing the task in hand the very best I can."

"Now if you will excuse me for a while," said Doug, "I will attend a conference with some of my staff. Remember what the people want is 100 per cent of serious effort—and making pictures is serious business whether you are shooting comedy or tragedy. The public soon learns the attitude of those behind a picture." And with that he was off with that springing gait of his which reveals such abundant energy.

That reference to the public turned my thoughts to "fans" and their letters and I at once asked if I might see Mr. Fairbanks' morning mail, or rather that portion of it which was from his admirers.

"Mercy, yes," was the response from an attendant. "We get thousands of such letters every week and we answer every one of them which calls for an answer."

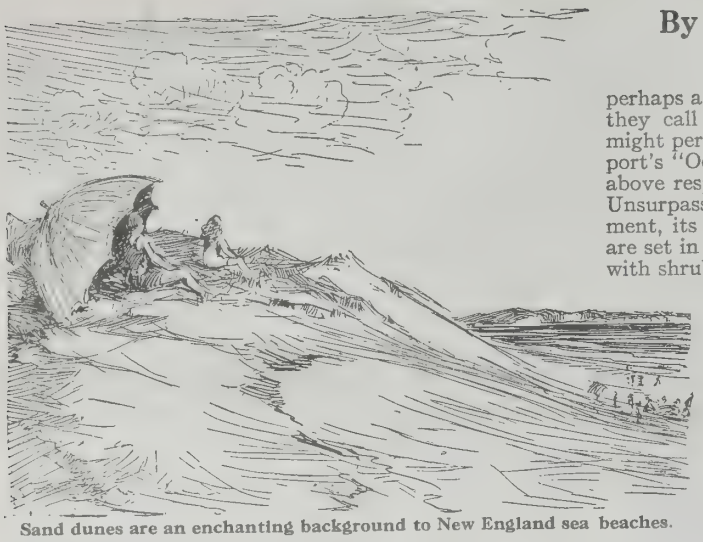
I was shown into a small office where a boy turned from reading a serial story, long enough to relinquish the morning's grist of "fan" letters. His manner was not at all reassuring as he handed me a big bundle and I feared that possibly I was to be disappointed after all.

Perhaps the receipt of "fan" letters by hundreds and thousands does become monotonous to some but for me these letters were like glimpses into the hearts of people—folk from the rank and file, whose chief relief from the humdrum of toil is an occasional picture show. It was remarkable, too, the wide range of territory which these missives represented. The very first one was from Antwerpt, Belgium. "Daer Sir," it began, "As I am a fervent picture goer I have often the opportunity to admire you in the silver sheet. Your acting is so real and human. I can assure you that my special 'star' will

(*Concluded on page 15*)

New England Beaches in Summer

By FLORENCE TAFT EATON



Sand dunes are an enchanting background to New England sea beaches.

TO "GO to the beach" in summer, either for a day's trip or for a real vacation, is the grand *summum bonum* of inlanders loving the sea, from the working girl whose greatest delight is a day's or evening's trip to the Coney Island-like resorts with which the New England beaches are sprinkled, to the artist or genuine ocean-lover to whom the lure of the lonely rocky cliffs, breaking waves, or stretches of shining sand is almost irresistible.

Years ago, when the trolley and the excursion boat were the only means of transporting trippers in numbers, the—what shall I call them?—beach midways were popular and even then crowded with gay merrymakers. Nowadays, the omnipresent automobile crowds them to an incredible extent night after night, Sundays, and during every holiday with a moving, jolly, packed throng who loup-the-loups, whirl on the merry-go-rounds, swing between heaven and earth on the Ferris wheels, crowd the dance-halls and movies, and indulge in every sort of game of chance, and in every variety of hot and cold, known and unknown "refreshment," both liquid and solid, that the ingenious brain of man can devise.

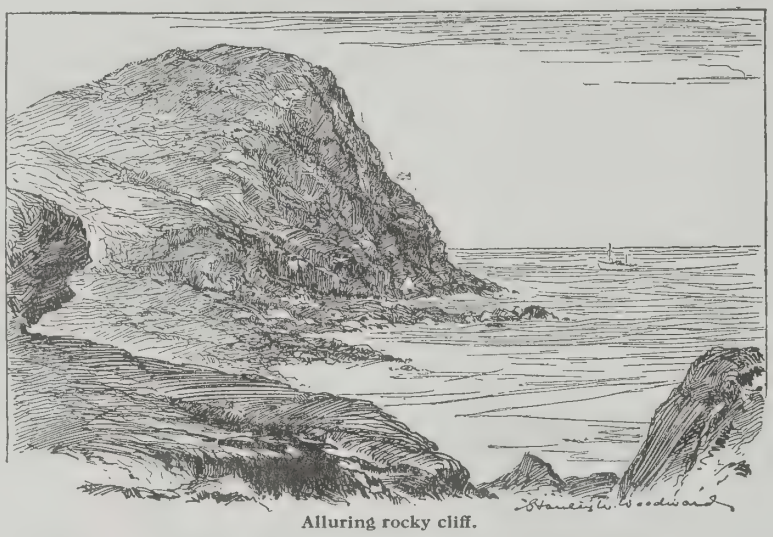
Revere Beach, near Boston, is typical of this order of beach resort, and, I suppose, from its convenient proximity to that and other cities and towns, entertains during the summer a greater number of ephemeral guests than any other place on the New England coast. It is a beautiful beach, with its miles of glittering sand, over which the long crested rollers curl placidly in calm weather, and upon which tremendous breakers rear themselves like giants, and thunder and pound during and after a northeast storm. One may, on ordinary weekdays, enjoy to the full a drive on the splendid beach, with its enchanting sea view, which Revere offers, and feel that there must be room and to spare; but beware of yielding to the temptation of a trip that includes this thoroughfare on a pleasant Sunday, holiday, or moonlight evening, unless you do not mind becoming an insignificant atom in a mass of moving, motoring humanity that creeps slowly, halts, creeps again, and so on, for miles before your destination is reached! A party of unthinking young people told me that they had yielded recently to a sudden impulse to "go to the beach" one moonlight evening, had spent three hours in getting over the few miles intervening, and then—within sight of their goal—turned round (with tremendous difficulty!) and started home!

Such resorts have their irresistible lure, however, for a great number of not-too-discriminating gay young people and—I must confess it—for most children. A dainty little maiden, taken on a day's outing through Revere off to an enchanting bit of natural coast, with a sea bath and delectable dinner at an attractive hotel as part of her entertainment, when asked what she liked best of the day's pleasure, replied without the slightest hesitation: "I really *liked* the funny place best!"

Similar New England beach resorts are York Beach, not Harbor—shades of generations of Harborites forbid!—Rye Beach, Hampton, and a dozen others, all catering to this sort of transient entertainment with their gaudy hotels, gay booths where all sorts of seafood is offered, their innumerable "shows," games of chance and thrilly adventurings, and, for the vacationers so inclined, the tiny jig-saw houses—"Bide-a-wee," "Lazy-Day," "Galrustic," and the like—packed together like sardines, where neighbors can shake hands from window to window. Similar summer resorts and entertainments do the shores of the Great Lakes offer to trippers and holiday-makers in other parts of the country; but the ocean itself, I think, has an especial and particular lure all its own that no lake, however grand, can emulate.

Then there are the New England sea towns frequented by persons of fashion and wealth, where "cottages," whose beauty, grandeur, and size can hardly be imagined, are occupied by those possessing this world's goods in such abundance that they can winter at Palm Beach, run over to Europe in the spring, summer in Newport, with perhaps a short time in the autumn in the establishment they call "home." The fashionable part of Newport might perhaps be typical of this variety of resort. Newport's "Ocean Drive" is, I imagine, as wonderful in the above respect as any stretch of coast in New England. Unsurpassed in regard to location and ocean environment, its gorgeous palaces—I can use no other word—are set in the midst of stretches of emerald lawn starred with shrubbery, flower beds and borders whose luxuriance and beauty are marvelously increased by the mild sea air and moisture, and include, on the sea side, a beauty of ocean scenery that is almost unimaginable.

Newport, too, has its "Coney Island" end; but its "First," "Second," and "Third" beaches—marvelously beautiful and vast—will almost always allow the real ocean lover a degree of solitude and privacy. A trip to the Newport beaches in September found its "funny places"—to quote my small friend—closed; and the wonder and beauty of the long stretches of the shining sand, crested breakers, and—best of all to my mind—masses of enticing rocks, could be enjoyed without too much contact with one's too often obstreperous kind. May I stray from my subject just a bit to comment upon an interesting enterprise undertaken by the Newport Garden Club? A most attractive ample lot including many large trees was loaned by some interested person, where is laid out and maintained a lovely garden. It is mainly a rose garden, but luxuriant plantings of other flowers—both annuals and perennials—add to its beauty. The landscape architecture of the whole is charming, and comfortable shaded seats tempt one to rest and enjoy indefinitely. "Maintained for those who love flowers," is the hospitable invitation. Surely a beautiful thing for a Garden Club to undertake!



Alluring rocky cliff.

Then there are the beaches where one goes for clambakes! Baked clams are always the high light in the menu of any hotel at the populous beaches and are a dainty to be found only in the close neighborhood of the sea—for they are only possible where absolute freshness is guaranteed. Hotel baked clams are produced in some mysterious way from unseen culinary regions; but the beach clambake which is planned to be in evidence, where the preparations and whole process are almost a part of the feast—surely adding to its interest and enjoyment—is a different matter.

Beach clambakes are enjoyed all up and along the New England coast, but "Little Rhody" is primarily the headquarters of the clambake. It is accomplished as follows:

A large shallow pit is dug in the sand and lined with cobblestones. A big fire is then made in this, is kept roaring and planned to be reduced to coals when the stones are hissing hot and proclaimed by the master of ceremonies to be "just right"; it is then swept clean by

The artists' easels are set up in all sorts of odd corners.

Where the children may wade, bathe or dig in the sand.

steady, alternate swings of long birch-brush brooms, wielded at opposite sides of the bake. This is a hard, hot job, and, I well remember in my picnic days, not coveted by amateurs! The required number of clams, washed clean by the hose, are then *carefully*—to avoid breaking the shells, the breakage of which in any extent indicates a very poor job!—but rapidly dumped on the hot stones, live lobsters are tucked in cosily, green corn in the husks also given a place, and, if you wish, sweet potatoes. All is then comfortably covered by a thick layer of clean wet seaweed and a wet canvas put over all, that not the smallest wisp of steam may escape. How delightful is the anticipation of the clams and various delectabilities; and what fun to sample a just-right clam at the proper minute! And when the "bake" is uncovered, the pans of steaming clams distributed with the preferred accompaniments—always including plates of hot steamed "Boston Brown Bread," and watermelon for dessert—gastronomic delight can go no further! One doesn't forget, either, that the bake is covered between times so that "seconds" and "thirds" may be kept just as temptingly hot; and—dear me!—I almost forgot the plates of unlimited fresh doughnuts! But no one forgets them when on the spot!

This is the old-fashioned Rhode Island clambake. Possibly methods may be occasionally more conventionally changed, but results can never be made more satisfactory!

Besides the thronged beaches which offer specialized attractions, add the ultra-fashionable seaside resorts, the long New England coast is fringed and bordered with charming, less crowded bits and long stretches of shore, dear to the heart of really and truly sea lovers. To these—and they are so numerous and extensive as to be comfortably available—are tempted families for a long, lazy summer, when not-too-liberal incomes are planned so that the mother may obtain whatever rest may lie in picnic housekeeping, and obtain the refreshment of the sea air and the change; where the children may wade, bathe, and dig in the sand, and the father may enjoy his Sunday; to them the more solitary or the "workers of the world" go for a vacation, and the stay-at-home is tempted for week-ends or trips. These are the beaches that are really loved, a first visit to which is always remembered, and to which one returns whenever possible. To these more remote, less populous but always picturesque beaches come the artists—shoals of them! Provincetown and Ogunquit are typical artists' colonies that come to mind—and for the time being make the place their own. They themselves constitute a most picturesque element in the life of such beaches and add much interest to the various summer settlements of which they form a part. Their easels and big umbrellas are set up in all sorts of odd corners—sometimes the casual and non-artistic observer wonders as to the why and wherefore of the attraction! One of the Giants is Master of Art in a real artists' colony—as Mr. Woodbury in Ogunquit—and is worshiped and followed by enthusiastic and hard-working devotees.

Connected with such beaches are delights innumerable. To me there is nothing so perfect as a climb, with book, pencil, or work, on to some alluring rocky cliff, where one is tempted on and up, and on again until the perfect corner is reached where one who loves the sea can pass indefinite time in doing nothing but watching the vast open stretches of water and, best of all, enjoy the pounding of the waves upon the rocks, and the breaking of their crests into towering, enveloping creamy spray, rising to inconceivable heights.

Then there are the delightful little shingle beaches, scalloping into the sand beach between cosy arms of rock, filled deep with the smoothest, most enchanting egg-shaped pebbles, where every receding wave is followed by a crackling, indescribable rattle as the millions of pebbles sink together again.

The bathing beaches have, naturally, an attraction all their own, and there is no delight connected with the sea that, to its devotees, equals that of sea bathing, whether one takes part in the vast assembly clad in every fantastic costume imaginable on some fashionable or popular big bathing beach, or enjoys the comparative privacy and freedom of the smaller ones.

Mr. Ford's Page

THE fact that a law is violated does not mean that that law is bad. Burglars consider that laws against housebreaking should never have been framed, gunmen are of the opinion that the statute which makes it an offense for them to take the lives of their fellow men is all wrong, and thugs in general are quite certain that their liberties are unnecessarily curtailed by legislation of any kind. Yet no one would assert that the burglar, the gunman, and the thug are right.

Yet we find that there are people who say that the Eighteenth Amendment is all a mistake because it conflicts with one of their abnormal tendencies. One might as well argue that the New Testament is all wrong because the ethics of Christianity are unpalatable to a large proportion of the human race, or that because there was a Judas among the twelve apostles the other eleven were to be everlastingly discredited. What is right can never be made wrong owing to the right having been ignored or disregarded. Such wild philosophy would be laughed out of any school of ethics.

Why is it that some people do not obey certain laws? Simply because those laws are not in harmony with their own peculiar likes and dislikes; because those laws are a barrier to their vices or, shall we say, weaknesses; because those laws are antagonistic to their pet inclinations.

Nero and Diocletian thought that Christianity was bad, but their opposition and persecution neither discredited Christianity nor killed it. Those emperors, great as they were in their own estimation, were centuries behind the times. But before Christianity was ever heard of there were edicts against the excessive use of intoxicants.

There never was an invention or discovery put at the disposal of mankind but caused a great deal of worry among some of the people. When Harvey discovered the circulation of the blood, his fellow physicians considered him a lunatic; when the first steam engines were set running on rails there were otherwise enlightened people who foretold that a blight would fall upon nature and that the country would be ruined; when the first illuminating gas was used, it was denounced as a menace to public health, and people used to touch the lamp-posts with their finger tips to find out if they were growing red-hot.

When the first steamboats were floated the skippers of all the "windjammers" that sailed the seas declared that if those floating locomotives were permitted, the sailing ship would have to go out of business to the utter ruination of the commerce of the world and the sending of thousands of worthy mariners to the poorhouse. When labor-saving machinery of any kind was adopted it was the signal for all kinds of human moles to declare that it was labor-ruining machinery, and that starving millions would follow. Those who did not worry at the advent of the telegraph or the telephone, laughed at them, or said they were devices of the devil, and that the postal department would crumble because there would be no more letters to deliver.

Thus every measure that has been for the benefit of mankind has had to pass through a stormy period, and this is just what is now happening to the Eighteenth Amendment.

Modern civilization wants increased speed because increased speed means increased efficiency, but a high standard of efficiency cannot be attained or maintained without *clear thinking and quick action.* Prohibition is one of the means by which clear thinking is accomplished.

Who are they that are principally interested in the continuance in the traffic in liquor? Are they altruists who think that the liberty of the subject is being restricted because he is being protected against himself; are they those who grow rich at the expense of the peoples' health and morals, or are they the people who at present are the bootleggers' best customers?

Apart from those who wish to make easy fortunes by its illegal sale, the principal opponents of the Volstead Act are those who consider that the consumption of liquor is essential to their happiness. Looked at from this angle it is the buyer and not the seller who is most interested. It is the consumer and not the producer.

When pedestrian traffic was much greater than it now is, some unfortunate would now and then have to be saved from under the hoofs of horses or from stumbling into a lake or river. But in these days of rapid transportation it is the driver not the pedestrian on whom safety most depends. This is the age of quick action, and to have quick action we must have clear thinking. There can be no clear thinking if the brain of a man is befogged by booze. He becomes a madman on wheels and a madman on wheels is a deadly menace to public safety.

AN ARM is raised to knife the Constitution of the United States in one of its most vital parts. The Eighteenth Amendment is the object of this menace. The country is not behind this. It is the work of those who are deprived of piling up wealth on the weaknesses of their fellow men. There is nothing sincere in any movement based on the assumption that a law which is for the benefit of the community as a whole must be bad because it deprives a section of that community of the opportunity of preying upon the others. The burglar and the bootlegger as violators of the law are in the same category. They are at one in their opinion that those who seek to restrict their activities are doing them an injustice. Are we on the side of the burglar and bootlegger, or that of sound citizenship?

But it is not only on the ground but in the air that clear-headedness is required these days. The age of the airplane is approaching, and the thought that these machines should ever be in charge of pilots who are not consistently alert in mind and body is appalling.

There are some people who pretend to have a hankering after "the good old days" when everything moved much more slowly than now, but are we to move backward fifty years or so, to seek these conditions? Surely the proportion that would wish to exchange present conditions of living and transportation with those prevailing half a century ago is negligible.

Retrogression is not in accordance with the spirit of the American nation. No nation can move backward or even mark time and retain its place among the countries of the world. It is not retrogression that is desired, but progress, and this progress can never be maintained if it is hampered and nullified by what the great majority of American people believe to be a pest and a plague.

What America wants to do is to raise up a race of sane, sober men, men who will not only hold their own with those of other countries but will excel all others in service and attainment. This has always been the ambition of every American citizen, and why should it be changed now at the behest of a section by no means representative of public opinion, or men of American nationality.

We believe that if the opposition to prohibition were analyzed it would be found that it was mainly alien. We believe that every true American is for it heart and soul. We believe that if prohibition were to be put before the nation tomorrow there would again be an overwhelming flood of public opinion in its favor. Although the friends of prohibition may not be so aggressive as its enemies, they are firmer in their convictions.

It is not in the wide open spaces that the defiance of the prohibition laws are the most prevalent, but in the crowded urban centers where alien influence and alien eagerness for money-getting is at work.

After its five years of trial, prohibition is not a failure. *It is the people who have neglected to correspond with it who are the failures.* If it took Christianity hundreds of years to obtain a footing, why should anyone consider five years sufficient for a tryout of the greatest reform since the introduction of Christianity itself? The good that has already come from it infinitely outweighs the evil, and the evils that are, do not arise from prohibition but the failure to practice it.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Millions More for the Farmer

THE recent announcement by the Secretary of Agriculture that the farm outlook is the best in five years, while of particular interest to the American farmer, is likewise of deep concern to business men throughout the country, for the farmer's buying strength goes far to determine whether times will be prosperous, or the reverse. The statement that the American farmer will have $10,000,000,000 to spend at the end of the crop year next June—a billion more than in 1922—will mean the maintenance of the farmer's purchasing power and a continuance of agricultural support for general prosperity, assuming, of course, that no great change in the general price level of farm products takes place.

The fact that farm products and livestock production in the United States last year had a total value of more than $12,000,000,000—more than half of the entire national debt—is reason for nation-wide rejoicing. The values amounted to more than $1,000 for every person, male or female, above ten years of age, employed in agriculture or its allied occupations. These figures suggest the magnitude and importance of farming in this country. And while the figures cited for 1924 show a tremendous decline from those of 1920, when crops and livestock values were more than $21,000,000,000, one must remember that in 1920 values were enormously inflated. It is not at all certain that in proportion to the prices of the things he must buy, the farmer's values were any higher than in 1924.

Just now there is a slump in the price of wheat. But as practically all of last year's crop, except that reserved for seed, had been sold before the slump came, the speculator in grains, the miller, and the middleman, not the farmer, are more likely to be injured by this decline in prices. In fact, this slump may be a blessing in disguise to the farmer. Had wheat remained around $2 a bushel, he would have been tempted to increase his last year's acreage of spring wheat. Then, with a production larger than the world's requirements, we probably would have had dollar wheat again. That is, since the farmer is not financially able to hold back his crop from the market, and must sell it virtually as soon as it is harvested, the middlemen, the millers, and the speculators would have bought this wheat for perhaps a dollar a bushel, and held it for an increase in price.

The great feature about the present situation, according to the Department of Agriculture, is that the country has finally worked out from under its paralyzing surpluses. The decks are fairly well cleared for a new deal. The world reserve of wheat, corn, cotton, and wool needs to be replenished. Farm production on the whole is in better balance than at any time since the war; both the domestic and foreign demands for farm products are good, and promise to remain so for at least another year. Hogs, cattle, dairy products, wheat, corn, and poultry in the corn belt promise to bring more money than last year.

General prosperity cannot be built upon a discouraged farming population. Unless the farmer can keep his debts paid, his farm buildings in repair, his family contented; unless he can educate his children and be assured of a fair return on both capital and energy invested, the whole country suffers. The farmer is interested in the same governmental policies as the rest of us—economy in expenditure; reduction in taxes; and a fair share of the profits of our common toil. That he is getting them is now evident. The farmer has turned the corner; he will have a billion dollars more to spend this year than in 1922.

Agriculture and Business

GEORGE M. REYNOLDS, Chicago banker, argues for the preservation of the Federal Reserve System. From his point of view as a beneficiary there is little to criticize, but he makes some astonishing statements regarding finance. For example, he asserts that war financing, had it not been a part of the system's work, would have been accomplished in another way—thus denying the practically unanimous claim of his colleagues that in no other way could it have been possible.

In premising one of his statements, Mr. Reynolds alluded to the improved condition of agriculture and industry as positive evidence of a returned prosperity. The statement was made, without doubt, before the marked slump in both grain and stock markets.

Whether this slip was the result of carelessness or—luck, let us say, the break had occurred, and Ernest Pool, New York correspondent of *Investment News*, had pointed out, five days before the appearance of the Reynolds interview, how he had cautioned his readers from the start in November that no basis existed for the speculative boom, and that keen eyes were watching to grasp the opportunity to raid the market. His only surprise was that speculative prices had been maintained so long far above a legitimate level.

That Mr. Reynolds' optimism was unwarranted is best shown by a quotation from Mr. Pool which fits as if made for the occasion:

> "Amateur traders and business men are probably wondering why, when such optimistic comments are given by Secretary Hoover and Secretary Mellon, that both basic and barometric conditions are such as to make present and future prospects very favorable, and the general business situation the country over is decidedly satisfactory, why there should be such drastic breaks in quotations of shares actively traded in on Change. . . . Contrary to the opinion held by Mr. Herbert Hoover, reports that reach me concerning business activity throughout the country are not altogether of the encouraging nature. The truth is, business is halting."

Mr. Pool also declares, what should be apparent to all, that very little trading in shares or in actual grain was done during the rise in stocks and farm crops. Practically all the business was done as a pure gamble.

Is Feng a Fraud?

IS MARSHAL FENG, "The Christian General," a humbug or not? One newspaper has received "from a reliable source in China," a statement that "Marshal Feng is now acknowledged, by those who know best, to be a patriot, and not a traitor," and that "he dared obloquy and the stigma of turncoat, because his gaze was fixed on the greater good of China."

That oft-quoted dictum of Dr. Samuel Johnson that "patriotism is the last refuge of a scoundrel" is no proof that there are no patriots who are not scoundrels, for the dour philosopher of Grub street was not infallible in his pronouncements.

Feng's reply to the attacks made upon him is that his one object in cutting loose from his fellow general and marching his fifteen thousand men into Pekin was to end the war, which he had concluded had dragged on long enough at considerable cost of life and property without anything being attained for the good of China.

Feng is not the first general who in his heart of hearts has seen the futility of sacrificing blood and treasure merely to satisfy the ambitions of petty aspirants to power, or to appease the rancor of individuals who had fallen out over the division of spoil or the distribution of honors.

If the object of Feng is the greatest good for the greatest number there is nothing that China needs more. Feng has a good opportunity of satisfying the world that he at least means well.

Exit Herriot

PREMIER EDOUARD HERRIOT of France has gone the way of Ramsay MacDonald. He rose to power in much the same way, and he demits office for the same reasons. These days no politician can afford to allow his personal proclivities to rule his policy. Those who are "for a party" and who forget that they are also "for the state" can never give their best to their country.

The rumblings of discontent with the extreme radicalism of M. Herriot, and his high-handed attitude toward Alsace-Lorraine, have been heard for some time; his unpopularity with the people of France as a whole has been evidenced by the public demonstrations which have been held in various parts of the country. The recent election of ex-President Millerand was an outward and visible sign that popular resentment could no longer be restrained. It was a deliberate buffet to the prestige of M. Herriot, whom, it will be recollected, declined to take office with Millerand as the supreme executive.

The conservative and nationalist element has been the biggest thorn in the flesh of the Socialist premier. M. Herriot, like Ramsay MacDonald, has given too much ear to the extreme left of his party. France wants good, constructive government, not party politics nor party prejudices.

Her outstanding need is financial reconstruction. If M. Herriot had devoted his attention to this and refrained from meddling with matters for which there was no immediate urgency, his power might not so soon have waned. The inflation of the currency and forced taxation in the form of a capital levy are measures toward which he has been driven by the force of circumstances.

France has been in the hands of usurers since long before the great revolution, and the dragons' teeth that were sown in those days are now being reaped a hundredfold. It will require a strong hand and a firm and unprejudiced mind to drag her out of the slough of age-long improvidence.

Ratting on Prohibition

THERE is a movement in certain quarters to tear the Eighteenth Amendment to pieces before it has had a chance of proving its worth. We ask those who are urging the booze hounds to the attack to look at the good which this measure has wrought before going further. There are urban centers where alien influences lurk in the dark corners where the bootlegger flourishes, but these influences are not representative of American opinion because they are not American. Let those who are ready to rat on this question look around. Let them go to the communities scattered all over the country where decaying industry has taken a new lease of life and where men who were losing their manhood have brought renewed vigor to workshop and farm.

It is, after all, these communities that are genuinely representative of this great country, not the distorted alien mind which seeks first to undermine the *morale* of the citizens and then to reap a harvest of shekels.

The Volstead Act was adopted after the matter at issue had been discussed in all its angles from the Great Lakes to the Gulf of Mexico. It was looked at in all its bearings, and the public opinion in its favor was overwhelming. We believe that this opinion would be as strong as ever if put to the test.

A Precious Thing

DURING these lovely days of spring has anyone noticed the beautiful cloud effects and the glowing sunset skies? These masses of watery vapor, when lit up by the ever-changing effects of sun and moon, are among the most beautiful things in nature. The poet Shelley says:

> "I am the daughter of earth and water,
> And the nursling of the Sky."

The clouds are like living things, and they among all the natural phenomena are perhaps the things that most closely resemble a human soul. They rise from the moist earth or the surface of the sea, invisible, to take their places in the blue dome of the heavens, and there, transfigured by the radiance of the celestial orbs, they look down on the world in their ever-changing grandeur, until, as if pitying the world beneath them, they dissolve into rain that the earth may bring forth its fruits.

A drop of water is perhaps one of the most precious things with which creation has been endowed. No peerless pearl or gem can equal it in its benefit to mankind.

Wiles of the Gasoline Bootlegger

Including Paying for a Filling Station Job Before Being Paid

By JOHN M. ROBERTSON

THE gasoline bootlegger who sells automobile owners "memberships" purporting to entitle them to discounts on gasoline and oil purchased at his filling stations, as well as free emergency services, has also fleeced many credulous men seeking jobs as filling-station operators out of thousand-dollar or bigger cash "deposits" required as "proof of their dependability."

Such bootleggers can purchase odd wholesale lots of gasoline and oil of dubious origin and quality, at prices lower than the established brands of responsible companies. Their other sources of supplies have features of instability that are better known to the oil trade than to the consuming public.

One group that has been exploiting this field of public service has also added as a side line the fake sale of insurance against theft, burglary, and robbery to small tradesmen, many of whom are foreigners.

Cleveland, Detroit, Chicago, and Los Angeles are the favorite centers of promoters and high-pressure salesmen of speculative or shady enterprises. The first two cities have had the gasoline scheme introduced by a band of adventurers some of whose members, who are as yet neither prisoners nor fugitives, are reported to have sought footholds in Chicago and Los Angeles. The rest of the country will doubtless receive attention as soon as the more lucrative cities have been worked.

The salient personalities in the Motorade Corporation of Michigan; the Supreme Oil Company; the Savin Oil Company; the so-called Michigan Merchants Association and the Mobilade Company deserve description before their latest exploits are dealt with.

Abe J. Joseph, formerly of the stock-jobbing firm of Goodman & Joseph, of Cleveland, promoted a motorade corporation in that city. In January, 1923, the Ohio Securities Commission authorized the sale of a small portion of this corporation's authorized capital stock of ten million dollars. In May, 1923, the commission revoked this authorization because sales were being made on grossly unfair terms.

Then they started selling motorists ten-dollar "memberships" in the corporation. These memberships purported to entitle their holders to gasoline and oil at a discount, legal services, towing and other helps to distressed automobile owners. Joseph, as fiscal agent, got eight dollars out of every ten-dollar membership and the corporation got the balance.

Joseph secured a considerable part of the funds for this corporation by getting men desirous of employment as its filling-station operators to deposit one thousand dollars. These "depositors" were merely given so-called gold notes in return for their money. Their money was not kept on deposit but used in the business.

A couple of Cleveland judges were made directors of this motorade corporation, which claimed to furnish its members with legal defenses. The judges resigned these directorships when their attention was called to their incongruous positions.

While involuntary bankruptcy proceedings against this Cleveland concern were pending, an oil company with a Jewish executive bought the eight filling stations of this "motorade" and other assets. These carried on the books at $207,000, but were sold for $20,000. Among these assets were $40,000 "gold note" deposits of candidates for filling-station jobs who were thus wiped out.

Meanwhile, the Ohio Securities Commission revoked the license of Goodman & Joseph to sell stocks—no new experience to them; they had previously received official discipline for their behavior in connection with the sale of the stocks of the ill-starred Pittsburgh Tin Plate & Steel Company and the American Iron & Steel Corporation.

Goodman & Joseph's romantic record also includes the promotion of the Friend Motor Company of Pontiac, Michigan, which promptly went into receivership after these "brokers" had rewarded themselves richly.

A valued collaborator of Joseph's in Detroit was Joseph Holbrook who was associated with the promotion of the notorious Hawkins Mortgage Company of Indiana, most of whose principals have been convicted in Federal court. Holbrook turned informer. He was also associated with the Toronto Cement Corporation and its promotion and his relation thereto have been roundly denounced by the Canadian press.

Holbrook succeeded Calot Morganthaler as fiscal agent for the Detroit Packing Company. This concern and Morganthaler were adverted to in the article upon "myself notes" which featured Colfax Gibbs. (See THE DEARBORN INDEPENDENT of August 9, 1924.) Holbrook has recently been indicted in Detroit for the alleged participation in the trade of 120 shares of stock in a concern that ceased operations four years ago for property said to be worth ten thousand dollars.

William Miller, who left Bellevue, Ohio, under a cloud after his promotion of the now defunct Supreme Oil Corporation, came to Detroit and organized the Supreme Oil Company, which was financed somewhat by getting men to "deposit" one thousand dollars against hopes of getting filling-station jobs, as Joseph had been doing in Cleveland.

Incidentally, Miller introduced himself to Detroit by obtaining money from a local bank upon a forged Bellevue bill of lading.

A Miss Steffen, 5840 Pennsylvania avenue, Detroit, can never forget Miller and the filling-station job deposit game. She is a deaf-mute who has learned lip reading and thus laboriously supports herself at a clerical position. Her two brothers persuaded her to advance them her savings of two thousand dollars, which they deposited with Miller's company in the hope of securing filling-station jobs. The company promptly failed and Miss Steffen lost her accumulation. Heart-rending personal tragedies always follow high-pressure promotions.

Abe Joseph dropped out of Cleveland after the Motorade Corporation had passed into other hands at the expense of the original "investors." He showed up in Detroit in May, 1924, and, together with Joseph Holbrook who has been described and Leon Stern, organized the Motorade Corporation of Michigan.

This new motorade outfit then made arrangements for its "members" to be supplied with gasoline from Miller's Fenkell avenue filling station, which was leased, at two cents a gallon discount. Thus we find such choice spirits as Abe Joseph, Joseph Holbrook, and William Miller, whose promotional records are unusual, getting together in the public service. The lease placed this filling station beyond attachment by Miller's numerous creditors. Joseph, Holbrook, and Miller could benefit from the station without fear of molestation by Miss Steffen.

Membership salesmen for this motorade claimed that the Michigan Refining Company would furnish gas at discounts to motorade members. This was denied by the Refining Company officials. These membership salesmen claimed, without the slightest justification, that the largest accessory store in Detroit would give discounts to motorade members. They also made numerous promises of legal, insurance, towing, and other services, which were never fulfilled. The sales manager blandly stated, after several months' supervision of these membership salesmen, that he did not know their assurances were not being performed by the corporation.

This motorade also worked the filling-station job deposit game by getting $1,500 from men who wanted to operate its filling stations, using this money as working capital.

It should be understood that persons who made these "deposits" to these different concerns were governed by the verbal representations and did not read the printed receipt or certificate until in many cases they attempted to get their money back. Then they found they had merely been given a note payable at a date to be fixed by the company that had taken their "deposit."

While this Motorade Corporation of Michigan was getting under way in Detroit, Benjamin Levy, a former salesman for Goodman & Joseph, began trading in Detroit under the title of "Michigan Merchants Association." He was soon succeeded by M. Joseph, Leon Stern, and himself, a co-partnership, trading under the same name: Michigan Merchants Association.

The Michigan Merchants Association put out squads of high-pressure salesmen who offered small shopkeepers in Detroit a contract that purported to give them free collection service; a private patrol past their doors every 30 minutes throughout the night; holdup, burglary, and open-stock robbery insurance.

All that the policies really gave was $500 six a.m. to twelve p.m. holdup coverage. Policies issued were not delivered, and in many cases the insurance company received no applications from the association and therefore insurance that had been paid for was not written up at all.

As for other protection, the association delivered to its members brass plates bearing the words: "Protected by Watts & Whalen," a detective agency whose operatives are uniformed so they closely resemble policemen. Watts says he was unaware of the methods of the association, that he had merely agreed with them to furnish its members a free examination after holdups, and service for 80 per cent of regular prices.

Benjamin Levy, one of the three partners in the Michigan Merchants Association, had a broker's license for the insurance company covering these members so lightly. The association proper and its membership salesmen did not have licenses to sell insurance, as the state law requires.

Acting upon complaints, the prosecutor and the Better Business Bureau began a joint investigation of the Michigan Merchants Association. At the outset Levy loudly claimed he was a friend of big politicians and told the prosecutor to "chase himself." Levy's attorney firmly maintained that nothing could be done with his client until a member of the association suffered a loss and was not indemnified and thus qualified to institute legal proceedings.

However, the discovery that the individual salesmen of memberships giving insurance protection were not licensed enabled Levy's legal armor to be pierced, punctured, and utterly wrecked. Insurance Commissioner Leonard Hand summoned all the interested parties to Lansing for a hearing of the complaints. He named 10 o'clock as the hour for the opening of the hearing. Although the morning train from Detroit does not arrive until after 10 o'clock, Levy and his attorney, feeling quite cocksure, took this train and calmly invaded the Commissioner's office one hour late.

Upon being asked to describe the two other partners in the Michigan Merchants Association, Levy informed the Commissioner that M. Joseph was a brother of Abe Joseph, the motorade genius. He had previously made this declaration to the prosecutor. Asked for more details about M. Joseph, Levy maintained he was a prominent business man of Detroit. Cornered by stern cross-examination, Levy admitted he had been lying and that M. Joseph was none other than our old friend Abe Joseph who for "personal" reasons was masquerading.

Commissioner Hand then announced the Michigan Merchants Association's membership contract was illegal since it mingled insurance with other things.

He also ruled that the association as such had no right to place insurance as it had no license and that it was further violating the law by having its unlicensed salesmen write insurance. As for Levy, he was given two weeks within which to show cause why his personal license to write insurance should not be revoked.

Abe Joseph then ostensibly retired from the motorade to organize the Mobilade Corporation in Detroit. He was succeeded as president of the Motorade by the malodorous Holbrook. In fact, one characteristic of the operations of this group is the way in which they would switch titles and companies. That this resulted in confiding people with whom they dealt suffering severly is shown by the following case:

A man who answered an advertisement of the Motorade, which offered a guaranteed contract to haul gasoline, was informed he would have to purchase a certain make of motor truck from a specified dealer. This he did, paying $5,500 down on a $9,300 truck, a very substantial fee for membership in the sucker's club. Abe Joseph signed the hauling contract for the Motorade Corporation. When the trucker showed up to perform his work he was informed Joseph was not with the Motorade and the contract was unauthorized.

However, the Motorade generously offered to give him a new contract if he would surrender the one signed by Abe Joseph. Unfortunately, the trucker found the rewritten contract was without the guaranty clause. He was put to work for the Savin Oil Company, of which Holbrook is now president and is merely eking out a living in sorry contrast to the promises of the advertisement and the terms of the contract signed by the elusive Abe Joseph.

The subsequent criminal indictment of Holbrook, the head of the Motorade Corporation of Detroit, has made the situation of its stockholders and depositors still more involved, because Abe Joseph and Benjamin Levy skipped out of Detroit when "ade" affairs no longer furnished a lure for them.

Joseph and Levy tried to launch the "American Merchants Association" in Chicago, following the model of the interesting Michigan Merchants Association. Unfortunately the Chicago detective agency head whom they had interested came to Detroit and mentioned his new allies. He was quickly put in contact with those who had called Levy to account at the hearing in Lansing and returned to Chicago a disillusioned man.

Joseph and Levy apparently then headed for Los Angeles, the western haven of promoters and high-tension operators. Los Angeles bankers in querying Detroit correspondents have identified the attempted promotion of the Motorade scheme there.

Persons who are requested to make big cash deposits either to secure or to hold positions should first submit the written contract to a good lawyer or a banker known for his business capacity.

Here is a story that may save you money and sorrow. Read it, and if you are ever approached with any of these schemes, get all their "documents" but sign nothing.

Demand that every promise be shown in black and white—and then don't sign. Salesmen are not responsible for "promises."

Demand the guaranty that promises will be fulfilled—and then don't sign. Your name is your own until you give it away.

See a good banker first. The dotted line is often the path of folly.

David E. George as J. Wilkes Booth

House Painter Who Posed as Lincoln's Assassin—Sixth Article

By F. L. BLACK

A MAN known as David E. George asserted at El Reno, Oklahoma, in April, 1900, that he was John Wilkes Booth. This time a woman was the recipient of the "confession." As it created an awkward situation for Finis L. Bates, chief author of the Booth myth, to have a David E. George make the same claim that John St. Helen had made, and as it was obvious that if one of them was Lincoln's assassin, the other could not be, Mr. Bates simply disposed of the difficulty by asserting that John St. Helen and David E. George were one and the same individual, and that individual was Booth. Thus the myth was apparently lifted over a fatal danger point. Mr. Bates simply says that St. Helen dropped out of sight at Forth Worth for a number of years, and was rediscovered again at Hennessey and El Reno, in Oklahoma, as George. If St. Helen were George, the same general characteristics would be evident, the same man would appear. With this in mind, the investigation was pursued in Hennessey, El Reno, and Enid, and because the reports received in these places would involve some repetition, only the El Reno and Enid phases will be presented at length. It was at Enid that David E. George's sordid life ended in suicide.

Bates located David George at Hennessey, Oklahoma, in 1899, under the name of George D. Ryan. This, however, is a needless attempt to increase the sense of mystery. George lived in Hennessey under his own name of George, and earned his living as a house painter. He was a drunkard and a morphine addict. It is during this Hennessey period that Bates begins to weave another web of mystery around the remittances which he says George received from the outside world. These "mysterious remittances" were used to establish the idea that "Booth's" relatives were secretly supplying him with funds. But the postmaster and paint merchant in sworn statements declare, the one that George never received remittances, and the other that George could scarcely meet his paint bills. Bates also has George purchasing a "$3,500 cottage" at El Reno. The records at the courthouse show that on February 25, 1902, George paid John J. Davis $350 and gave a mortage for $350—making only $700 in all—for a small place in El Reno, which he sold again on July 3, 1902. But of this "mystery money" we shall hear more.

The George angle of the Booth myth is made by Mr. Bates to rest largely on the alleged statements of a Mrs. E. C. Harper.

He says, "Mrs. Harper makes the following statement:

" 'Mr. George (Booth) had been a resident of the Territory for several years. He had always been well supplied with money, the origin or source of which no one knew, for from some mysterious source he received a regular remittance. He was a familiar figure in Guthrie, El Reno, and Enid.' "

In conversation with Mrs. Harper (who had since become Mrs. Young) January 21, 1921, she denied any knowledge of D. E. George having received remittances from any source, and said that if he was a familiar figure in Guthrie and Enid she was ignorant of it; that she had known him but a few weeks and actually knew him but slightly.

From this point we shall refer to Mrs. Harper by her later name of Young.

Continuing, Mr. Bates claims that Mrs. Young said: " 'My acquaintance with Mr. George led me to believe him to be a very different person from what he represented himself to be as David E. George, the painter. He was eccentric, and though he claimed to be a painter of houses, yet he did no work.' "

In her sworn statement of January 21, 1921, Mrs. Young says: " 'During the time I knew Mr. George he was a house painter and worked quite steadily at this trade.' "

Mr. Bates, still claiming to quote Mrs. Young, says: " 'At one time the young people of El Reno had a play of some kind. One of the actors became ill and Mr. George (Booth) filled the place to the great admiration and entertainment of those who saw him. When surprise was expressed at his ability as an actor he replied that he had acted some when he was a young man.' "

Mrs. Young says in her statement of January 21, 1921: "I was told by a friend, whose name I do not remember, that at one time a traveling troupe of players was going through El Reno, and that Mr. George went to see them; that one of them who took the part of a drunken sailor was ill, and Mr. George offered to take the part and filled it very creditably."

Mrs. Young, in a statement made to Mr. Bates in 1903 and again to the present writer in 1921, says that she first became acquainted with D. E. George in March, 1900, and heard his "confession" in April, 1900. She was married May 21, 1900, and immediately moved from El Reno. She knew Mr. George for only a period of two months. Yet Mr. Bates begins her story with the intimation that she had known George for a long time.

The "confession" of D. E. George does not at all agree with St. Helen's as to how they both, as John Wilkes Booth, escaped from Washington. In Mrs. Young's statement to the writer, she says that at the time of his confession Mr. George "said that he had friends in Washington, who, after he escaped from the theater in which he killed Lincoln, had hidden him in a trunk, and got him on a boat for Europe where he had remained for ten years."

The actual statement obtained from this lady by Mr. Bates is here given. The portion printed in italics was not used by Mr. Bates. Apparently it did not suit his purpose, and to cover the defect he used several pages of alleged conversation.

Mrs. Young (Harper) said in her 1903 statement to Mr. Bates:

"On the eve, of January 13th I was startled, and surprised, by reading in the Enid *Daily News*, the suicide of David E. George, of El Reno (of whom I first became acquainted with in March, 1900, in El Reno, at the home of Mr. & Mrs. J. W. Simmons). Mr. Harper went down on Wednesday morning the fourteenth of January and recognizing him, told the embalmers of a 'confession' that David E. George had made to myself, and that they had better investigate. I went to the morgue with Mr. Harper on the fifteenth, and identified the corpse as David E. George.

"In April, 1900, David E. George, took a drug (supposedly morphine), with suicidal intent, and I being at the time a visitor, in the home of J. W. Simmons was called upon to help attend him and watch by his bedside, while said Mrs. Simmons was, necessarily, absent part of the time assisting in the care of the patient. With the promise from me, that I should sacredly keep the secret he was about to divulge, till after his death, he voluntarily told me that he had killed 'one of the best men that had ever lived, Abraham Lincoln.' That he was John Wilkes Booth. He asked me to procure a pencil, and paper, and he wrote upon it, 'I am going to die, before the sun goes down. J. Wilkes Booth,' and handed it to me. I proposed sending for a Doctor, but he vehemently protested, and proceeded with the details of the confession, finally becoming unconscious. Mrs. Simmons sent for Dr. Arnold. His subsequent manner impressed me with the conviction that he was whom he had confessed to be, as he thought, on his dying bed, 'J. Wilkes Booth.' As brevity has been enjoined upon me, I will close by simply stating that I have merely outlined, his confession."

A comparison with Mrs. Young's (Harper's) statement as quoted by Mr. Bates will show that he not only omitted from his book part of her statement, but when publishing it, added, "Will reaffirm my former statement made in detail of David E. George's confession to me at El Reno, about the middle of April, 1900, as fully as if same were set forth herein."

There is no doubt that D. E. George made the "confession" which Mrs. Young describes in her statement, but it was admittedly made under the influence of morphine.

The following statements of W. E. Robare and C. R. Miller describe D. E. George's "gentlemanly" disposition, his "highest degree of intelligence," his "refinement," his "fluent and captivating conversation," descriptive terms used by Mr. Bates to describe George's personality:

Statement of W. E. Robare:

"I was Chief of Police of El Reno during the time that D. E. George lived here, 1900 to 1903 and remember him very well. I lived about a block from J. W. Simmons' place while George boarded with them. One day he came home drunk and got into a fight with John Sams, Mrs. Simmons' brother, over some trivial matter. George threatened to kill Sams and went to his room for his pistol, a six-shooter. Sams got out of the house and ran down to my place, and I went back with him. Old George came out to meet us with the six-shooter. Sams jumped behind me while I took the pistol away from George and arrested him. I took him down to the police station and 'Progress' Smith [George E. Smith] went on his bond. I kept the pistol and still have it in my possession. After becoming sober, George promised he would never start anything again, and I turned him loose.

"At Police Headquarters, we considered D. E. George as harmless when sober, but a little dangerous when drunk, or under the influence of morphine. He loafed in the station a lot during the two or three years he was in El Reno. He was nobody's fool and must have had a good education. He was tall, had a dark complexion, and his hair was quite mixed with gray. He was always fairly neat, but did not have fine clothes. His eyebrows were heavy and were perfect matches. He did not limp and had a southern drawl. One would take him for a Kentuckian. George considered McCartney of the 'force' and myself as friends. He was a morphine fiend and I saw him under the influence of the drug quite often. He didn't take heavy doses as a regular thing. I am absolutely positive as to his using morphine. We had quite a few 'dope' fiend cases down here in those days which gave us considerable experience with them. He was frequently on a drunk for several days at a time. From the description of his actions he had taken poison when he made his confession to Mrs. Harper here in El Reno in 1901. I was called in at the time he took this poison at Mrs. Simmons' home, at which time he made this confession through Mrs. Harper. I was just leaving the room when I noticed that he motioned for Mrs. Harper to come to his bedside and stopped at the head of the stairway where I heard part of the conversation. I noticed that Mrs. Harper was badly scared, she called me downstairs immediately afterwards and told me of his confession, which was to the effect that he (Mr. George) was John Wilkes Booth who killed Abraham Lincoln. She told me that he said that if he died she might tell this fact, but that in case he lived, he would kill her if she did so.

"Soon after he first came to El Reno he once told me that he had drawn a land claim and that his fortune was made, which he sold soon after. At no time did he have much money. He worked steadily at his trade, house painting, and could easily have made all the money I ever saw him with by the painting he did."

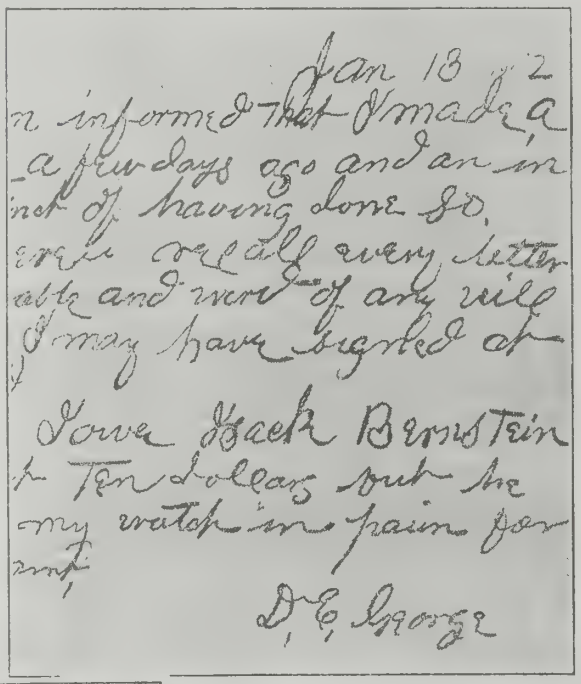
Statement of C. R. Miller, of El Reno, Oklahoma:

"Yes, I remember D. E. George. I ought to. He left here owing me over $40 for paint. I sold him paint for a couple of years and dye for his mustache and hair. He bought quite a lot of paint during that period and I had always considered him fair pay. For a number of years I owned the cottage which George bought from John J. Davis at 107 South Macomb Street, lot 18 and 19, block 92. As a matter of fact I sold him the paint with which he painted the house. I remember that I passed this house one day while George was working on it and stopped in and talked to him. George lived up with the Simmons' a while in that house. He drank a lot and loafed around the store, but not often when under the influence of booze. I never heard him intimate that he was other than D. E. George. It is rather funny, but while George was here he was known only as an old drunken painter, but as soon as the story got around that he might be John Wilkes Booth all the people that had ever seen him were telling how he quoted Shakespeare and how dramatic he had been. It seemed that then all knew there was something different about old man George. Although George paid his bills, except the last one, he was always hard up and never had any money. Personally, I never considered him more than an ordinary painter, not very good or very bad. I never heard of any recitations that he made here. He mumbled to himself when drunk. He came in the store once and said that he was going back home, some place in Arkansas. Sometime later, he came in and told me that while he was gone he had attended a 'nigger' wedding of some 'niggers' that he knew and said that the 'niggers' had had a preacher come out from Little Rock for there was no preacher good enough for them in the little town. I do not remember that Mr. George was more than ordinarily neat. He was never what you would call slovenly. Sometimes he would get morose spells and hardly talk at all."

Mr. Bates says: "When the editor of the El Reno *Democrat*, in which paper he put an advertisement as a tradesman of house painting, at a cost of four dollars a month, thinking it a useless expense, so universally was it known that George, or Booth, did no such work, suggested this to him, George or Booth, indignantly demanded to know if the editor was uneasy about the price of the card, if so he would pay for it in advance. The editor apologized and the card continued from month to month for two years, up to the date of the death of George.

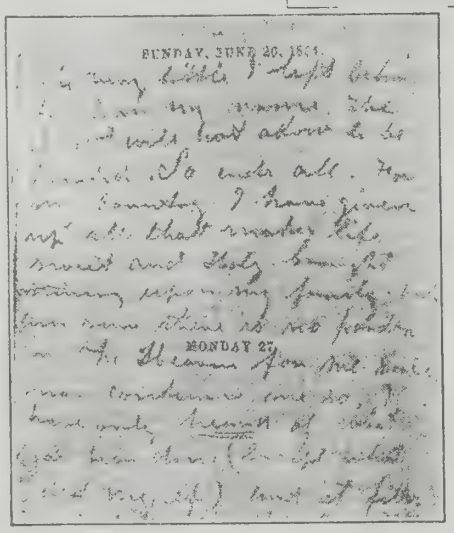
"Booth's purpose in this is obvious. He wanted to keep himself constantly before the public as a painter, not that he wanted work, but to keep alive his identity as a painter while he played the deceptive character. The little cottage painted for Mr. Anstien was the stage setting to the character, the card in the paper was his program and he played to a successful finish this drama of the journeyman painter."

This interesting theory is badly shattered by the facts as given by Tom F. Hensley, a state senator, in a statement made for this paper at Oklahoma City, January 13, 1921. He was editor of the El Reno *Democrat* in 1901-02-03. He said that he knew D. E. George quite well, that George advertised in his paper for a while, but being slow to pay for his advertising, it was dropped. That it was unnecessary anyway since it was well known all over town that George was a painter. After the advertisement was dropped Mr. Hensley said George came in and kicked, and was quite insulted about its removal, and it was replaced for a short time.



Above—A letter written by D. E. George just before he committed suicide. He wrongly dated it 1902 instead of 1903. He says, "I am informed that I made a will a few days ago and I am indistinct of having done so. I hereby recall every letter syllable and word of any will that I may have signed at Enid. I owe Jack Bernstein about ten dollars but he has my watch in paun for the amt."

The will referred to was dated December 31, 1902, and left most of his mythical estate to Geo. E. Smith. Jack Bernstein was an Enid saloon keeper.



At the left is part of a page in John Wilkes Booth's handwriting from his notebook. This was printed in the April 11 issue of *The Dearborn Independent*. A careful comparison shows no similarity in the handwriting.

Mr. Hensley said that around El Reno George was considered just a drunken bum and painter, a down-and-outer, not particularly polished, and never had any amount of money. Mr. Hensley said that a woman, who said her name was Laura Ida Booth, wrote a letter from New York City to him claiming that George was her father, and that about the same time he got a letter from Laura Ida's brother, both of which letters rather impressed him that George might be John Wilkes Booth. He said that he wrote the brother, but never heard further from him, but got several letters from Laura Ida Booth in which she was quite anxious to know about the estate of the deceased.

Mr. Bates next devotes space in his book to "Press Comments on the Suicide of David E. George." He takes the liberty of changing these where necessary to make them fit his version of the story.

In his reprint of a story copied from the Wichita *Daily Eagle* of January 22, 1903, which in turn was copied from the Enid *Wave* of January 21, "eyes" is changed to "eyebrows" in the sentence "The eyes of the dead man are not mates in appearance." "Almost" becomes "absolutely" in the sentence "The Booth chin, mouth, upper lip and general description is *almost* perfect in the corpse." He changes a story that appeared in the Enid *Wave*, January 21, 1903, where it describes D. E. George's handwriting as "large round-lettered schoolboy writing," to "the round, little, scrawley boy writing." The change makes the description more nearly fit the writing of John Wilkes Booth. Although a number of additional instances like this can be pointed out, enough has been quoted to indicate the character of the book.

The Enid *Daily Wave* of January 13, 1903, carries the story of the suicide of David George, stating that it occurred about 10:30 a.m. and that the body was removed to the undertaking rooms, the coroner finding letters to George from George D. Smith, Colfax, Iowa, and thought he might be a relative and wired him.

Mr. Bates then brings in "The mysterious Mr. Smith" whom he presents as the fiscal agent of the Booth family who is supposed to have supplied D. E. George with regular remittances. Upon investigation in Enid and El Reno Mr. Smith was easily found and promptly disposed of the "mystery."

"I first met D. E. George in my store at El Reno, Oklahoma, about a year before his death," wrote Mr. Smith to the author of these articles July 16, 1921.

"D. E. George told me very little about his past, he intimated to me at one time that he had killed a man in Texas, never intimated to me that he was John Wilkes Booth, but several times, while under the influence of liquor, assured me he was a man with a past, and that I would be very much surprised after his death to learn who he was.

"I did believe and still do after D. E. George died that he was really John Wilkes Booth and that big money could be made by exhibiting the remains. After his death I went to Enid, looked the situation over and then went South to consult some lawyers, whom I was acquainted with in El Reno, but was advised by these lawyers that in the eyes of the government John Wilkes Booth was buried and exhibiting the remains of John Wilkes Booth would constitute a felony, by obtaining money under false pretenses. There is no question that at that time while excitement was high, about getting the crowds at an exhibition. However, I did not want to get into trouble with the government over the matter, so allowed the proposition to drop.

"I never attempted to communicate with any of the Booths

"I never knew that George was addicted to morphine.

"George never appeared to have a surplus of money, but appeared to have plenty for ordinary purposes, except when he got on a spree, when he used to borrow small sums from me.

"He appeared to work steady, but sometimes was out of town for a week or two at a time, claiming he had been doing some jobs elsewhere. I believe he always worked on his own contract.

"I cannot tell accurately how much money I loaned him, as the amounts were usually small and promptly returned, except the last two loans. As I recollect it, one amount was for $10 and the last amount was for $25, just before he died. These loans I never got.

"I expected to be reimbursed for the loans I made before he died, and was not worrying particularly whether he paid me back or not, as I enjoyed his company; he was always honest about returning the loans, and until the last two when he advised me he would leave me some property to more than cover the amounts due in case he did not return same before his death.

"I decided to return home and let the matter rest until I could get more information as to whether or not I would be able to exhibit the remains. As I got very little encouragement from the lawyers I spoke to and time passed on I dropped the whole matter.

"I believe this is about all that would interest you, but will call you up the first time I am in Detroit. Since seeing you I wrote my nephew in Los Angeles where the body had been on exhibition and inclose his reply. I have also had a number of letters from Mr. Bates, requesting an interview and wanting me to join him by advancing some money to help meet expenses. I expected to see Mr. Bates before this, but have not been South and as for putting any money in the proposition I do not feel inclined to do so.

"Yours truly,
(Signed) "Geo. E. Smith."

When Mrs. Young (Harper) saw the stories about the suicide of George, she recalled his "confession" three years previously, and went with her husband and told her story to the undertaker, who had previously been a New York newspaperman, and saw its news and publicity value. The Enid, Oklahoma, papers played this story for all it was worth and dispatched it to the newspapers of many larger cities.

Mr. Bates, in Memphis, Tennessee, saw the story in the Sunday, January 18, Memphis *Commercial Appeal*, which carried it, headed, "Wilkes Booth a Suicide." On the supposition that there might be some connection established between George and St. Helen, he started for Enid, where he arrived January 22.

To support the theory that George and St. Helen were the same, Bates says in his book that a letter had been left for him by the suicide but was stolen from the body in the morgue before he arrived. This letter, he insists, must have been the basis for a telegram received by him on January 17, asking him to come to Enid and identify the body of John Wilkes Booth.

The alleged telegram, being quite a new point in the matter, led to inquiry. Questioned by the writer, Mr. Bates said he could not produce this wire as it had been lost.

Penniman, the Enid undertaker, says: "Bates read of George's death in the newspapers and wired me asking if he could see the body if he came to Enid." Bates himself, after quoting four press reports, says, "These have merely been used *for the secondary purpose of showing how I became advised of the suicide's death.*"

Although Mr. Bates maintains that he started for Enid the afternoon that he received this "wire," January 17, he did not arrive in Enid until six days later, and covers this with the story that he was delayed by washouts on the Frisco system. Since the running time from Memphis to El Reno is only twenty-two hours, the washouts must have been of considerable size, but an investigation covering the period from January 15 to 25, 1903, fails to disclose washouts on either the Frisco or Rock Island lines. The conclusion, therefore, that the wire was imaginary and that David George did not write Bates before he died, is quite in harmony with Mr. Bates' own statements and the facts.

Mr. Bates' book gives a highly colored account of his arrival in Enid, in which "it was estimated that more than fifty thousand men, women, and children had viewed the body of Booth." It is interesting to note that Enid had a population of 3,444 in 1900 and was in a sparsely populated country at that time.

Bates then describes with considerable detail his visit to the Penniman undertaking establishment where "cold, stiff and dead, I beheld the body of my friend, John St. Helen. After a separation of more than twenty-six years, I knew him as instantly as men discern night from day, as the starlight from moonlight, or the moon from the light of day.

"In a few minutes I recovered. I realized now for the first time that I was in the presence of John Wilkes Booth, though I had, in fact, been told so more than a quarter of a century before. I had the tintype picture which St. Helen had given me at Granberry, Texas, twenty-six years ago. I took it out and called upon Penniman and the attendant to bear witness with me to the identity of this dead man with the picture, which

An imaginary pen sketch, reproduced from the Bates' Book where it appears with the cut lines, "Booth (as D. E. George) Playing the Role of a House Painter, and the Only Painting Job He Ever Did."

I showed them, when they replied without a moment's hesitation:

" 'We need no picture to identify this man in your presence. Yes, this is the same man. It is an axiomatic fact, not debatable, they are one and the same man.' "
[A picture of the dead body taken at this time shows that it was greatly bloated and does not look at all like the tintype of St. Helen. Mr. Bates' recognition after twenty-eight years was, however, "instantaneous."]

"We then compared the high thumb joint on the right hand[1], the small scar on the right brow—the uneven brow—the scar received in the accident mentioned by Miss Clara Morris, raises this brow to an uneven line with the left[1]; the right leg[2] was examined and we found a slight indentation on the surface of the shin bone—Booth's leg was not literally broken, there was a fracture of the shin bone six inches above the ankle; I should say a split or slight shivering of the bone, for besides the indentation on the front of the shin bone there were small scars plainly discernible, where particles of bone seemed to have worked out through the skin (St. Helen, Booth, told me this himself), leaving small round scars, while the general shape of the leg at this point seemed curved a little. His eyes, head, forehead, chin, mustache and hair were all the same as John St. Helen's, taken at the time before stated, and given to me, the only difference being that the hair and mustache were streaked with gray now, especially the mustache, which was quite gray at its parting, under the nose."

Commenting on Mr. Bates' story of his call at the undertaking rooms, Mr. Penniman, in a letter to THE DEARBORN INDEPENDENT, says: "This was a pathetic attempt on the part of Mr. Bates to make his arrival sensational and mysterious. Arrived at 6 p.m.; called me to the hotel and kept me there until long after midnight. He came to the store in the morning; wept when he saw the body; said it was his friend John St. Helen—John Wilkes Booth. His book account of all this is 'bunk.' He first identified the body as his friend John St. Helen by a bare unsupported statement and afterward by the papers you have examined.

"I was never able to see any striking resemblance between the body and the tintype. In fact, Bates asked me to do all I could to make the body look like the picture and so we combed the hair and mustache accordingly. As to any real substantial evidence offered to prove D. E. George was John Wilkes Booth, I guess you have examined all the 'real positive' proof Mr. Bates has in stock at this time, and have the ability to weigh its value. Bates is the only man who ever tried to convince me as to the real identity of this 'bird,' and he probably used the same selling talk that he used on you. It's good dope, but it doesn't carry."

William J. Ryan embalmed the body of George at the Penniman undertaking establishment and did such a good job that the body is still in fair condition, although looking very much like an Egyptian mummy. When last known it lay in state in Mr. Bates' garage in Memphis. Mr. Ryan says that he has never believed that it was the body of John Wilkes Booth, for the eyes were blue or blue-gray and John Wilkes Booth had black eyes. John St. Helen also had black eyes, and it will be remembered had something wrong with his throat, which made him wheeze. Those in a position to know claimed this was absent in David George. Mrs. Anstine, with whom George roomed for some time in El Reno, stated that his eyes were either dark blue or brown, but not black. Mrs. Young (Harper) stated that George had very large deep blue eyes.

Mr. Ryan says that the pigment in a man's eyes never changes color. Mr. Ryan positively states that no one he ever talked with had identified the body as Booth, except Mr. Bates, and that as far as he could see, both of George's legs were whole and sound.

Mr. Bates, continuing the story of his Enid visit, says, "However, with a manner that indicated indifference to surrounding dangers, I wended my way to the hotel, where Mr. Brown gave me the inside facts about Booth's, or George's, coming to the hotel. He said:

" 'The press reports about George's coming to the Grand Avenue Hotel and registering on the morning of the 3d day of December, 1902, are correct. While here George was a constant reader of newspapers, remaining in the reading room and office most of the time. He seemed to be a man of perfect leisure, paid his bills by the week promptly, was genial and pleasant in his manner, had a tendency to drink a little too much at times and remained up late at nights, but was a reasonably early riser. [Lee Boyd, who lived at the hotel, and Bob Wilson, who gathered the laundry, state that George was usually in bed at 9:00 a. m.] When I was on night watch he was great company to me; he was well read, often repeating parts of Shakespeare's plays and reciting other poetry, which it seemed natural to him to know, reciting it in such a manner as to be highly entertaining.

" 'At times George would become sad or rather thoughtfully silent. In these moods his discussions would drift to matters of the "hereafter." I asked him, "You mean after death?" He replied, "Yes."

" 'I remember one night we were alone; he was in what I called his "off" mood. He raised himself erect in his chair, and in a tragic manner, with gestures and expression suited to the words, he said:

" ' "Am I better than the dog? Oh, no. He is far better than I! He is capable of no sin or crime. Yet when he is found dead his body is placed in the garbage box. Then why not ship my body without a crate to the potter's field of the dog? But I, even I, a man, am unworthy that the putrid flesh shall be torn from my bones by the vultures that prey upon the flesh of the dead brute."

" 'These utterances were made with such strong self-accusation that I wondered what it could mean, and from that time on I watched every move of the man and listened attentively to every word he said. Whether it was what George said or the manner in which he said a thing, I can't quite understand, but what he said always impressed you. Of this I am sure, in all my twenty years' experience in the hotel business I have never seen such another character.

" 'He was a handsome man for his age. His black eyes, when in repose, seemed to have lost luster by age, but in conversation or when repeating verses from Shakespeare, or other recitations, they would kindle, flash and sparkle as if inspired or ignited into flame from the burning souls of the eternally damned, while his shapely face and magnificent forehead paled from his natural olive. Sitting or standing with a natural, easy grace, in such moods he made a picture one felt privileged to behold, and never to be forgotten. To my dying day the meeting of this man George, or Booth, will be remembered by me as an epoch in my life.

" 'It is true, Bates. Be this man who he may, George, Ryan [How did Brown know of Ryan at Hennessey when the Hennessey people did not know of such a man, but did know George? Bates himself had not got the Treadkel story of Smith at this time. How did Brown know it then?—F. L. Black.], Marr, St. Helen, Smith, or Booth, he is a man without a model. He looks like no one else, he acted like no one else and he talked like no one else that I ever knew or saw.' "

" 'Well, Brown, who is this man?' "

" 'I believe him to be John Wilkes Booth, as he stated on his dying bed. In fact, I don't think he could be any one else.' "

" 'Did he at any time before his death intimate his identity other than George?' "

" 'No, he did not. In his manner he was quite unobtrusive and mixed but little with the people in the hotel, and the scenes and recitations I have referred to would always be at a time when we were alone, and the people in the hotel supposed to be asleep.'

" 'I noticed that some of the press reports state that George committed suicide in the morning.'

" 'This was not the case. On the night of the 13th of January, 1903, George came into the office and reading room as usual and spent some time reading and finally writing letters. When he had finished the letters, about ten o'clock p. m., he said he was going down to the drug store, just half a block up the street. He was gone only a short time, when he came to the desk, obtained the key to his room and bade me good-night, requesting to be called for breakfast if he should oversleep his usual time. I saw or heard nothing more of him until about half-past eleven o'clock, when I heard groans coming from the first floor just above the office, in the direction of the room occupied by George. The watchman came in hurriedly

(*Concluded on page 14*)

[1]Neither is noticeable in authentic pictures of John Wilkes Booth and if they were there were not noticeable enough to have been mentioned in the many newspaper stories about him at the time of the assassination or in the descriptions.

[2]But the wrong leg—Booth's injury was in the left leg.

Gas Bomb That Awakened Rhode Island

Aftermath of Long Overdue Reforms Confounds the Reactionaries

By WILLIAM ROBINSON

Good sometimes comes out of evil, although it is not a safe principle to act upon.

A poison gas bomb was dropped in the senate chamber of Rhode Island during the hurly-burly session of 1924.

But the roughs and toughs and gunmen of that period overdid their act. Their bomb has become a boomerang which has swept away century-old abuses.

Long overdue reforms have been rushed through the legislature, with the co-operation of opposite parties.

Rhode Island rejoices and looks hopefully to the future.

IT MAY be remembered that, together with several other unusual episodes contributed to the world's history by the year 1924, Rhode Island, smallest of the forty-eight states in the Union, furnished the rest of the country with the spectacle of a legislative session in the State's General Assembly being broken up by the dropping of a poison gas bomb in the senate chamber, and the consequent flight to a neighboring state of the majority members of the Rhode Island senate, who forthwith announced that they proposed to stay without the borders of their own state until the then governor, William S. Flynn, Democrat, would guarantee to them their bodily safety as duly elected representatives of the citizens of Rhode Island, at least while they were in the legislative halls to which they had been sent by a majority of their constituents.

When Senators Fled to Another State

This guaranty the governor, who was of a different political party than the senate majority, refused to do. Governor Flynn was a Democrat. Twenty-two of the thirty-nine members of the senate were Republicans. The governor sneered at the alleged "danger" to the lives of the majority members of the senate. He declined to exclude from the senate chamber the groups of roughs and toughs and hurly-burlies who admittedly attended the sessions of the senate and whose numbers, character, and appearance gave that chamber the atmosphere of a decidedly second-rate pool room.

These gangsters, as they were afterward shown to be, jammed the chamber during the closing days of that fateful session of 1924 until the auditorium resembled an extremely thickly populated sardine can. They crowded about the chairs of the leaders of the majority party, and in so many words they threatened: "Open your mouths and we'll plug you."

Members of the majority appealed to the Democratic Lieutenant Governor Felix A. Toupin, a Frenchman, to clear the chamber. The lieutenant governor replied by ordering all the deputy sheriffs except one to leave the senate chamber. In other words, a free hand was given the underworld visitors.

For nearly two days and two nights, without food, sleep or relief of any kind, the majority members stayed in their seats in the stifling, smoke-filled, sweltering chamber under these conditions. Then a "bomb" composed of bromine gas was dropped on the floor of the chamber, while the lieutenant governor was being shaved in his chair on the rostrum by a barber who had been called in to thus "freshen him up." Four of the majority members collapsed after they had battled their way out of the gas-filled chamber. Two of them were sent to a hospital for treatment. The Democratic lieutenant governor was not greatly disturbed. It seemed that, purely by chance, his face was covered with a towel soaked in a menthol solution when the gas bomb was dropped.

Following this episode the majority members served notice on the governor that unless he would order the deputy sheriffs to maintain order in the senate chamber—which the presiding officer refused to do—they would refuse to return to their seats in the senate. The governor paid no heed to their communication, but the Republican majority learned that warrants had been issued for their arrest and return to the chamber. Then they fled to Massachusetts. They remained there from the middle of June until early in January of 1925.

They Came Back With Bigger Majority

With the dropping of the gas bomb and the flight of the majority members, the rest of the country awoke to the fact that political history, unique in the annals of America, was being made in Rhode Island, and throughout the length and breadth of the land the story of these unusual happenings was spread, in most cases the stories being tinted to suit the political leanings of the journals and periodicals which printed them.

For a national election was pending, and any subject of promise was grist for the political mills throughout the United States.

That election has come and gone. In Rhode Island the internal political outcome amounted to more in the eyes of the rest of the country than it ever had before. The issue was clear-cut and deeply stenciled. The party of the self-exiled senators went before the people of the state flatly on the issue of "mob rule versus orderly government."

The answer of the Rhode Island electorate was given on November 4, when the governor who had declined to have order preserved in the state senate was overwhelmingly repudiated, and stands today, in the opinion of many, a political outcast. The lieutenant governor, who turned the chamber over which he presided into a hang-out for blacklegs and toughs, was completely submerged, and his name is seldom mentioned today in Rhode Island. The majority party, who "fled their state," found that instead of a majority of 22 to 17, they now have a majority of 33 to 6. At any rate, the people of Rhode Island at the last election cried in a loud voice that they stand for the fundamental American principle of fair play.

That is, in brief, the story of what happened in the Rhode Island legislature of 1924. The issues at stake—and there were some very real issues—were completely submerged, obscured and overshadowed by the greater issue of the foremost of all American principles.

But what of the aftermath? Have the victors kept the faith?

The answer will be noted and analyzed and quoted far beyond the borders of the tiny State of Rhode Island.

In the first place Rhode Island is, in many ways, about the most reactionary state in the Union. Heretofore the term "political progress" has meant less than nothing within its meager confines.

Rhode Island's Archaic Enactments

Rhode Island is the most illiterate state north of Mason and Dixon's line. It still carries the property qualification clause for voters; that is, a person cannot vote for all the elective officers in Rhode Island unless he or she owns property valued at $132.

In Rhode Island people are still jailed for debt without even a hearing or an appearance in court.

In Rhode Island the only appointive power given the governor is that of a barber commission and his own executive secretary. He has had the power of veto but two years.

In Rhode Island the legislature every two years still elects an inspector of side paths, an inspector of scythe stones, a chain cable inspector, and so on, though it is doubtful if there are a hundred scythe stones or one-quarter as many side paths in the state.

In other words, many of the laws of Rhode Island are archaic—almost barbaric. But because they have been on the statute books since the days when King Charles of England granted a charter to "the Providence Plantations" they have remained there, hallowed and untouched.

All of which, though it may seem to be beside the point under discussion here, is decidedly relevant to it.

The minority—Democratic—party of 1924 professed to stand for the modernizing and civilizing of Rhode Island's constitution and laws. They went about the accomplishing of this matter in a czaristic and barbaric manner.

What is the majority—Republican—party doing about it?

Here—at least to one passably conversant with Rhode Island's unique political history—is the meat, the crux, of the whole situation, the point on which the entire political, industrial, educational—yes, even the financial—future of the state (and other states, too) hinges.

The young Republicans promised the abolition of the property qualification for voting, and this, for cities, has passed both branches of the legislature. They promised the popular election of sheriffs. They pledged themselves to the appointment of a bipartisan commission to consider and devise means for the eradication of the notorious "rotten borough" system in the senate, under which the town of West Greenwich, with a population of 307, has equal representation—in other words, one senator—with Providence, which has a population of some 300,000. This bill has already passed the senate this year.

Few Rhode Islanders will ever realize what screams of anguish went up from some of the leaders of the old school when it was proposed to pledge the party to these reforms. But the younger element stood firm. They realized that they must offer the people something really progressive and constructive.

Old Order Opens Its Attack

Well, the election came and went. The Republicans rode to victory.

After the halleluiahs of victory had died away the old order opened its attack. But it was not an open and direct attack. It was rather a secret sortie. It took the form of propaganda against some of the very measures the members of the old order had been loudly shouting for during the campaign. The younger element retaliated with a campaign of "pitiless publicity"; not against the oldsters in their own ranks. They were too canny for that. No; they announced almost daily the progress that was being made in the framing of the promised legislation, and from all that outsiders could find in these reports the goose was hanging high and sweet harmony reigned supreme in the ranks of the Republicans.

Meanwhile, some of the younger element were telling the oldsters where they headed in. They did it gently but firmly, with all due respect to age and experience. But they did it.

"You shouted for the abolition of the property qualification during the campaign," they said. "Now are you going to tell the people who listened to your promises that you didn't mean them?"

So far this year every piece of progressive legislation that has been acted upon has been passed in the senate—the "rotten borough" senate—and has yet to be acted upon in the house.

Uniting for Much Needed Reforms

And in addition to some of the platform pledges, the senate and general assembly have passed a bill creating a motorized state police force for Rhode Island. This, despite the wails of the lobbyists for the rum-runners, gamblers, and bootleggers whose happy hunting ground Rhode Island has been in the past, and who are indirectly, if not directly, identified with some of those high in the councils of the old order.

The Republican young bloods have joined with the Democrats in the drawing of legislation to take the election of judges out of the hands of the legislature and placing the responsibility for their appointment in the hands of one man—the governor. A divorce law commission is also to be established and also a children's code commission, the bills having passed the senate.

And there is still more of this kind of legislation on the program. A bill doing away with imprisonment for debt without a court hearing has been introduced by a Democrat, but the young Republicans are behind it. They are behind several other progressive Democratic measures, too, and this doesn't set well on the stomachs of some of the old-time Republicans.

Now, lest the suspicion should arise that a new senate has executed this about-face movement, let it be stated that of the Republican senators who fled the state after the gas bomb episode (which seemed to a good many Rhode Islanders a silly performance as the months of absence continued to roll by) every one who sought re-election was returned to office.

An Ill Wind That Blew Someone Good

Of the twenty-two who fled the state (one of them came back and stayed with the senate sessions to the bitter end) twenty were out-and-out Republicans. Two were Democrats who declined to tolerate the mob-rule tactics of their own party. One of these Democrats died during his exile from his native state. Of the twenty Republicans, eight declined to run for re-election, but in almost every instance the retiring member named his successor, and he was elected. The twelve who ran again were all re-elected, and among these was the Republican floor leader, Senator Arthur A. Sherman, who has directed the destinies of the "rotten borough" majority for several years past. He is doing business at the same old stand, and it was he who introduced and sponsored the state police bill. He and his returned colleagues are ardent supporters of the rejuvenated Republican party in Rhode Island.

What has the gas bomb to do with it?

Would it be surprising if the guess was hazarded that the gas bomb furnished the spark which set the fires of political reform ablaze in the antiquated Republican party in Rhode Island?

"'Tis an ill wind that blows no one some good," or something of that sort.

Montagu C. Norman—Man of Mystery

(Concluded from page 4)

The inspired writer is so carried away with this brilliant idea that he positively soars ecstatically into the empyrean as he goes on: "The high price of labor must be more than offset by vastness and variety of production, employing not only all available labor, but also every form of productive machinery and raising machine-power per available man to a maximum in every industry in which up-to-date machinery can be economically applied."

Answering the natural question, "Where are the funds to come from?" the inspired writer lets the cat out of the bag, or, to change the figure, shows the feet of the Ethiopian sticking out of the woodpile. It is all quite easy. To get these cheap and plentiful funds that will keep all the wheels of industry going—and at the same time enormously increase the purchasing power of gold—we are told that "*we must manufacture productive credits!*"

The proverb about the Devil quoting Scripture to his own profit is once more verified. Readers of THE DEARBORN INDEPENDENT will remember its exposition of the Guernsey Market Plan, of Mr. Edison's idea of a currency based on real wealth—productive wealth—and lastly of the very complete plan devised by Major Douglas, of London, and which he has been preaching up and down the land by pen and from the platform for some seven years past—a plain and practical engineer's solution of the problem of a safe and stable currency that should keep all the mills and factories and foundries busy by increasing the effective consuming power of the people through an increase in their purchasing power and proportionate increase in production by lifting from industry the burdens of *costs* repeated and multiplied that should be allocated to capital account.

Who could have thought that a plan designed to emancipate industry from the toll of the money lenders, to utilize to the fullest the exchange value of all forms of wealth and to free business from the effete fetish of metallic money finally and forever would be so proudly perverted to the purpose of intrenching and perpetuating the gold basis fallacy, and with it the power of the banking ring to continue extorting in steadily increasing measure tribute from honest industry. Compared with the genius of the governor of the Bank of England, all the "Napoleons of Finance" that have figured in Wall Street during the past several generations seem mere pikers, "tin-horn gamblers."

We will let the writer referred to fill out his wonderful picture. He tells us that these productive credits are to be well-secured, practically free and *certainly interest free*, under a Treasury Guaranty to be paid by the borrowers. The cumulative effect of this fund, he goes on, would be the required drastic cut in production costs, and the multiplication of supplies in proportion to an extension of effective markets, *which would make Great Britain more than ever before the greatest of International Marts.*

Mr. Norman would use the *interest-free productive credits* backed by government guaranty not to free the people's medium of exchange from the control of the bankers (whose only interest in it is so to manipulate it and monopolize it as to make it yield all the traffic will bear to the bankers) but as a sort of accessory to bank credits. That is, if the writer quoted may be regarded as his spokesman, "to make the currency elastic enough to meet the demands of so great a volume of business, there must be provided an adequate fund of *banking credit*—a check and bill currency—not legal tender. This to serve as a substitute for the reduction in the quantity of paper legal tender, as well as to provide for the monetary needs of vastly increased industry."

Now while the government guaranteed productive credit notes would be interest free, it is pointed out, the more elastic currency would have to be paid for to the banks by way of discounts of bills of exchange drawn in a prescribed form *against commodities*—on a plan similar in principle to that of the Federal Reserve System in the United States; banking credits being employed instead of Federal Reserve notes, "under adequate safeguards against needless demands for legal tender." The banking deposits to be used in this way as basis for loans would be largely increased by treasury guaranteed credits as these found their way into banking funds.

The inspired writer declares that the banks "would excel themselves in profit-making, despite the magnificent results they already achieve. "This is a passing allusion to the tact that the big joint-stock banks usually pay a dividend of from 18 to 30 per cent after passing almost equal amounts to reserves and to bank building accounts. Moreover, "the prosperity of the nation would yield the vast revenue required by the Chancellor of the Exchequer and enable the country to abolish death duties (inheritance taxes), income and supertaxes, all of which are described as piratical and a menace to British industry and commerce. If there is any truth in the rumors that Britain is to revert to the gold standard by a lifting of the ban on exports of that metal and the consequent re-establishment of the free market for gold in London, we are in for a financial reform the like of which has never before been vouchsafed to the masses of the people since the ruling classes became purely financial!"

The chances are that in their advocacy of a return to the gold basis with the "string" of a vastly expanded volume of the banking credits *which long ago superseded metallic and paper money as medium of exchange*, the money monopolists are building better than they know. So glaring a confession of the utter inadequacy of the gold basis should surely open the eyes of the people to the flimsiness of the metallic money myth. And they have been well prepared for the disillusionment by the successful experience of the past trying ten years with a purely "fiat" paper money in the shape of the British Treasury notes, which make no pretense of being "promises" to pay, being inscribed simply "One Pound" or "Ten Shillings," as the case may be; inscribed honestly as what they are.

There is little money in the world today which is really issued on a gold basis. Neither American Federal Reserve Bank dollars nor English Treasury Notes are actually representative of gold. As to recent fluctuations in the rate of exchange between Britain and the United States, the gold basis has nothing to do with the matter. That is regulated primarily by the actual trade between the countries—the exchange of commodities, including such commodities as gold, silver, copper, iron, steel. By a convenient convention, based on no law national or international, each country is usually willing to accept gold in payment of what might otherwise be an adverse balance. That simply because the gold may be sold to procure the "dollars" due to exporters from the United States, or pounds sterling to pay British exporters. But this *is*—not *may be*—equally true of any other staple commodity. Generally speaking, international traders will prefer to take what is due them in other staple commodities. There is more money to be made out of exchange of commodities (through the medium of book credits and credit instruments) than through the transformation of a cumbersome, risky, and expensive commodity like gold into the credit which is itself purchasing power. Goods are preferred to gold.

The recent marked rise in the quotations of the pound sterling, as measured by dollars, on the exchange market, it now turns out, was largely due to speculative transactions. The talk of the bankers, and the sedulously spread suggestion that with a return to the gold basis "the pound would go to par," probably originated in a determined effort on the part of the Bank of England to ease the payment of the most recent installment of Britain's debt. As an interesting side line, the financial managers behind the scenes provide the occasion for romantic sales of sterling for dollars. The sales stimulate an immediate demand for sterling; in stock exchange parlance, sterling becomes a "good buy." But these sales, as a matter of fact, are only a more or less remote indication of a demand for sterling—and the demand is that of the person himself who sells the sterling. The dollars obtained will be exchanged for sterling later on when fewer dollars will fetch more sterling—that sterling as quoted in dollars will fall again being a foregone conclusion.

Professor J. M. Keynes is probably one of the best informed and clearest thinkers among international economists. In an article in the *Nation and Athenaeum* on "The Return Towards Gold," he says: "The whole object is to link rigidly the City [London's financial district] and Wall Street. I beg the Chancellor of the Exchequer and the Governor of the Bank of England and the nameless others who settle our destiny in secret to reflect that this may be a dangerous proceeding.

"The United States live in a vast and unceasing crescendo. Wide fluctuations, which spell unemployment and misery for us, are swamped for them in the general upward movement. A country the whole of whose economic activities are expanding, year in, year out, by several per cent per annum, cannot avoid, and at the same time can afford, temporary maladjustments. The United States may suffer industrial and financial tempests in the years to come, and they will scarcely matter to her; but we, if we share them, may almost drown."

There speaks plain common sense, although it may not sound very "international."

Singers of the Woodlands

(Concluded from page 3)

of a preceding summer show no such local patriotism and returning in the spring from their winter homes they scatter about, how far and wide may be more fully determined by banding. Some of these young birds take the places of those that have turned up their toes and this is why we may hear, in a short walk afield, marked variations in the songs of certain species, assuming that the young males more closely inherit the vocal peculiarities of their parents.

In racial variations, as with the ovenbird, there is a very definite indication of these facts: the return to old nesting localities, the young males going no farther north, but sometimes stopping farther south lured by an unattached charmer and also, as above stated, the more northern individuals passing over and stopping briefly on the way to rest before the more southern birds of the species arrive. In the case of the hooded warbler it is evident that the individuals which breed in the more northern sections of its range migrate southeastward and winter in the Atlantic coast swamps and lowlands, while those of Tennessee and Western North Carolina winter along the Gulf Coast; thus the two extreme races are generally kept distinct, intermingling very little.

Individual habits and behavior of many species of birds may be closely noted and taken into account as proving, contrary to oftstated opinions, that nearly all kinds migrate. Except in the mid-southern coastal regions where certain species breed that also are found in the northern states there is probably only one passerine bird that is not more or less migratory. This is the Carolina wren, the sauciest, shrewdest, gayest, and one of the most musical little feathered creatures about which almost a volume could be written dilating upon its delightful habits and personality. Everywhere south of Long Island and the coastal region of Northern New Jersey, which is its northern limit, and east of the upland sections as far south as Middle Pennsylvania the Carolina wren, named from where it appeared to be the most common, remains in each locality an all-the-year-round fixture, not even leaving its chosen rocky hillsides, brush piles, windfalls or groups of old buildings, the young ranging in the autumn and winter to other and probably nearby localities, for thus I have traced them.

It has commonly been assumed, even flatly stated, that the hairy and downy woodpeckers, the tufted titmouse, the cardinal, and the song sparrow are non-migratory. Only may this be refuted by a careful observation of individual birds. At several different times I have put myself on rather familiar terms with certain individuals of these species, getting them well used to my presence about their summer and their winter haunts, noting their individual ways, hiding such tidbits as fat grubs cut from old logs and delectable grains that they might seek them out. With the hairy woodpecker this always proved a difficult task, as these birds are naturally shy, but the others met me halfway.

In every case the birds showing familiarity and peculiarities in consequence of my advances have suddenly left their summer homes or the localities where they sojourned throughout the winter and their places were filled by other individuals of the same species but with very different manners—shy, wary, not knowing where the tidbits reposed, roosted in different places. Most convincing is the fact that with the changing seasons these birds in turn disappeared and in the localities where they nested, when the time for the spring migrations came around, some of the friendly individuals came back, often year after year. There is a touch of sorrow about this sort of thing, however, for some of the little fellows never return, leaving one with the pretty certain conviction that they must meet some adverse fate in the long, hard struggle of a migratory existence.

In the southeastern coastal area and the northern and middle sections of the Gulf states a number of species are non-migratory, or at least those individuals are that breed in the general locality. Others from farther north, where it becomes worth while for them to seek warmer and more bug-infested spots, undoubtedly join the non-migrants, for almost suddenly the number of birds of a species is increased threefold, the nesters remaining and persisting in their friendliness with the observer, the mere sojourners continuing shy and suspicious. The cardinal's song and manners may both be taken into account in this regard. I made friends with one of these birds that had a most peculiar whistle, distinctly different from any of his kind and he made his home in the pine thickets of a spot in Southern Delaware for one year, others of his kind joining him in the winter and leaving in the spring, while still others that I had also come to know individually returned to build and rear their young.

McGuffey's Maxims

Little Tales of Conduct From the Famous School Reader of the Last Generation

THE CATS AND THE MONKEY

1. A FABLE is a story, in which animals or other objects are supposed to talk, although they never do so.

2. The moral of a fable is the instruction to be drawn from it. Here is the fable of the cats and the monkey.

3. Two hungry cats, having stolen some cheese, could not agree how to divide it. So they called in a monkey, to decide the case.

4. "Let me see," says the monkey, with an arch look,

"this slice weighs more than the other." With that, he bit off a large piece, in order, as he said, to make them balance.

5. The other scale was now too heavy. This gave the upright judge a fine pretext to take a second mouthful.

6. "Hold! hold!" cried the two cats; "give each of us his share of the rest, and we will be content."

7. "If you are content," says the monkey, "justice is not. The law, my friends, must have its course."

8. So he nibbled first one piece, and then the other. The poor cats, seeing their cheese in a fair way to be all eaten, most humbly begged the judge to give himself no further trouble.

9. "Not so fast, I beseech you, my friends," says the judge; "we owe justice to ourselves as well as to you. What is left, is due to me in right of my office."

10. So saying, he crammed the whole into his mouth, and very gravely dismissed the court.

MORAL

11. This fable teaches us, that it is better to bear slight wrong, rather than to resort to law for trifles.

David E. George as J. Wilkes Booth

Concluded from page 11

and we went at once to his room. On forcing his door we found him writhing and groaning in great pain. A doctor was called, he pronounced the patient suffering from the effects of poison and began vigorous treatment at once. The pains seemed to come and go, and George seemed to be suffering the greatest agony. After awhile I noticed that the pains or spasms seemed to come closer together, and the patient was drifting from under the control or force of the antidotes, and witnessed the most horrifying struggle for life I ever saw or ever could imagine. About four o'clock in the morning the doctor lost all hope of saving his patient, and informed George that if he had anything to arrange he had better do so. In the meantime Mr. Dumont, the proprietor of the hotel, had come into the room, the doctor having left. George said:

" 'I have only to say, my name is not George. I am John Wilkes Booth, and I request that my body be sent to the morgue for identification,' when death came and relieved the suffering of the man whose name we did not then know, and he died at 6:20 o'clock on the morning of January 14th, 1903.

" 'The undertaker was notified and George's body removed to the morgue, as he had requested. When it became generally reported that the man's true name was John Wilkes Booth neither Mr. Dumont nor myself had ever seen Mr. Booth nor any member of his family and consequently could not affirm or deny the fact of the true identity of the man, though I was ready to believe then, and do now believe, that George, the man who died, is, in fact, John Wilkes Booth, as he said. The truth is I would believe anything he said, and I understand that he confessed his true identity to a Mrs. Harper of this city, who has identified the body as that of Booth.' "

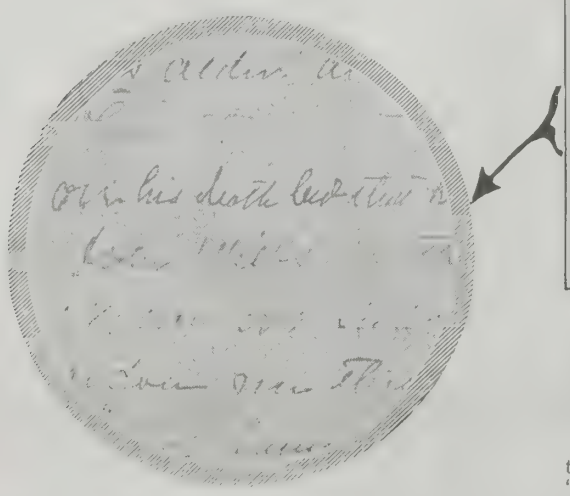
But what is passing strange is the fact that George lay in the morgue two days and *neither Brown nor the watchman said a word about this confession to the coroner's jury.* Had it not been for Mrs. Young (Harper), George would have been buried and the question of his identity never "established."

The statement of Messrs. Dumont and Brown, as published by Mr. Bates, now claims attention:

> "To Whom It May Concern: We, S. S. Dumont, proprietor, and B. B. Brown, clerk, of the Grand Avenue Hotel, in the city of Enid, and Territory of Oklahoma, declare that we, and each of us, knew a gentleman who registered as a guest of said hotel on the 3d day of December, 1902, under the name of D. E. George, who on the 13th day of January, 1903, committed suicide *in said hotel by taking fifteen grains of strychnine or arsenic, and died from the effects of said poison at 6:30 o'clock a.m., on the 14th day of* January, 1903, and that we have this day been shown by F. L. Bates, of Memphis, Tennessee, a small tintype picture, together with a photograph, and we say that said tintype picture and photograph are the same and perfect pictures or likenesses in each and every feature of the said D. E. George, the only difference being that George, or whomsoever he was, was older at the time of his death than when the pictures were taken.
>
> (Signed) "B. B. BROWN.
> "S. S. Dumont.
>
> "Sworn to and subscribed before me this, the 22d day of January, 1903.
>
> (Signed) "GUY S. MANOTT,
> "Notary Public."
>
> "My commission expires October 22d, 1906."

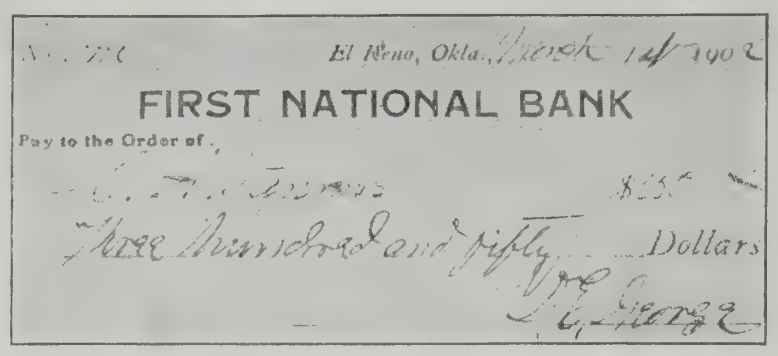
Compare this with a photostatic reproduction shown below and in the next column of the affidavit that was in Mr. Bates' possession.

This comparison of the original with that given in Mr. Bates' book, as reproduced above, shows that there has been added to the published affidavit these clauses: "*in said hotel by taking fifteen grains of strychnine or arsenic, and died from the effects of said poison at 6:30 o'clock a. m. on the 14th day of.*" The original written affidavit merely says "taking poison." Now look again at the photograph of the affidavit, as taken by Bates, in the space at the left of the signatures of B. B. Brown and S. S. Dumont and compare with that in Mr. Bates' book. In the written affidavit it states, "*George declaring on his deathbed that he was John Wilkes Booth,*" but the Bates' book does not repeat this line. The original statement as given by Brown and Dumont ended with the word "taken." Brown and Dumont then signed, and the notary finished his part of the statement and stamped it. Notice the ink spread in the words "on" and "John" when written over the seal—which shows that the addition was made sometime after the original statement was written. The remainder of the sentence after "*George declaring—*" had to be written



at the left of the signature, and was inserted by another hand after the affidavit was signed and sealed.

Mr. Bates' weird story of George's death agonies needed confirmation. How could there be a real deathbed "confession" unless the corpse could be kept alive long enough to make it! Therefore, in Mr. Bates' story George does not die until 6:30 a. m. of the fourteenth, whereas the Enid *Daily Wave* of January 13 shows that D. E. George died on the thirteenth. It is not often, even in these days of journalistic enterprise, that a newspaper actually reports all the details of a man's suicide, his removal to the morgue, and the impaneling of a coroner's jury over him the day before he dies!



El Reno, Okla., [illegible] 1902

FIRST NATIONAL BANK

Pay to the Order of

[illegible]

Three Hundred and fifty ... Dollars

[illegible]

The signature of D. E. George at the left. First below is "J. Wilkes Booth" written by George for Mrs. Harper when he made the "confession" in April, 1900, and second below J. Wilkes Booth's own signature. There isn't the slightest resemblance.

J. Wilkes Booth

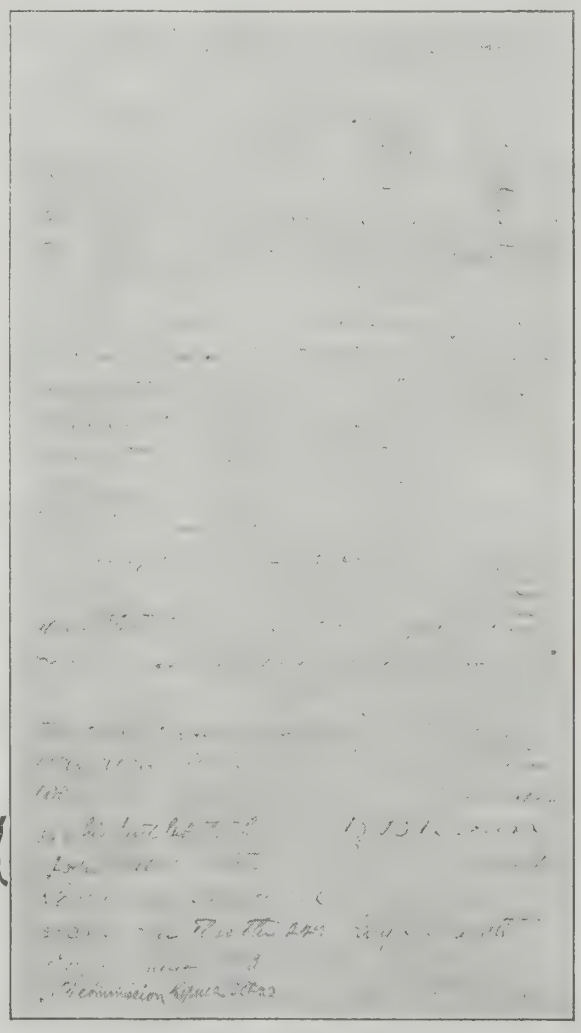
J. Wilkes Booth.

Mr. Penniman, the undertaker, states that George died about 10:30 or 11 o'clock on the morning of January 13. Even Mr. Bates quotes in his book Mrs. Young's (Harper's) statement that "On the evening of January 13th I was startled and surprised by reading in the Enid *Daily News* of the suicide of David E. George." The sworn statement of R. A. Field, M. D., who was called to attend George also attests the fact of the death occurring on the thirteenth. "He made no confession from the time I entered the room," says Dr. Field, "in fact he could not speak."

When David George's groans were heard on the morning of January 13, Lee Boyd, also a roomer at the Grand Avenue Hotel, was the first to enter his room, an inside hall bedroom the outer partition of which did not run up to the ceiling. Mr. Boyd, in his sworn statement, says, "I stepped on a trunk in the hall and climbed over the partition. George was lying on his bed partly dressed, groaning, and in convulsions. I opened the door and told Minnie to have Mrs. Dumont get a doctor. In about five minutes, Doctor R. A. Field came. Before he could prepare a hypodermic Mr. George was dead. George made no confession at this time that he was Booth, in fact, he did not speak, only groaned with pain."

George did not make a deathbed "confession." George was not St. Helen. Even St. Helen's alleged confession has no affidavits nor written statements to substantiate a single word of it, sources are not given, statements are misquoted, affidavits altered, an historical honesty absolutely ignored.

The next example of "evidence" does not rise above



Above—The original affidavit given Bates by Brown and Dumont with the sentence added "George declaring on his deathbed that he was John Wilkes Booth." At the left is a full-size reproduction of "on" and "John" showing how the ink spread when these words were written over the seal sometime after the original was signed and notarized.

the level of those already considered. Mr. Bates says, "Being a constant attendant at the theaters at El Reno, Enid, Oklahoma City, and Guthrie in the early part of December, 1900, Booth was much struck by the genius of the leading lady of one of the companies then playing in these towns, beginning at Enid. In fact, Booth regarded her a genius and sought an introduction through her manager, claiming at the time to be a correspondent of the *Dramatic Mirror*, of New York, and giving his name as J. L. Harris."

During one of our interviews, Mr. Bates stated that the actress he referred to was Mrs. Charles A. (Josie) Cameron, who was playing in "The Woman in the Case" at Enid, Oklahoma, in March, 1901.

Mrs. Cameron was found in Chicago and from her the writer learned that the Enid man who represented the *Dramatic Mirror*, to whom Mr. Bates referred, was John Walter Robinson. Investigation at Enid showed that Robinson had died a few months before George came. The Enid *Daily Wave* of October 13, 1902, carried a complete story of his death.

Mr. Bates next attempted to convince Joseph Jefferson that John St. Helen was John Wilkes Booth, but according to the following letter did not make much of an impression.

This letter was in answer to an inquiry from Mr. Oliver D. Street who in 1903 was Secretary of the Tennessee Valley Historical Society.

> Buzzard's Bay, Mass., June 10, 1903.
>
> "Mr Oliver D Street
> "Dear Sir:
>
> "In reply to your enquiry I beg to say that a gentleman called on me last spring and related to me his story contained in your letter. He showed me also a tintype much disfigured and asked me if I did not recognize it as John Wilkes Booth. I told him that it bore a kind of resemblance to him but that as I had not seen Booth since he was 19 years old and as the tintype was evidently that of a man of 55 or sixty it was quite impossible for me to give him any satisfactory information on the subject—and this is what he calls my "identification of Booth's remains"—rather weak evidence for such an important case—and I do not think that Miss Clara Morris (who also denies the identification) has had any further testimony beyond the uncertain tintype.
>
> "The gentleman further stated that he was trying to obtain the evidence so that he could get possession of the dead man's estate for his client. My opinion is that there is not the slightest foundation for the truth of this rambling story.
>
> "Sincerely yours
> (Signed) "J Jefferson"

Mr. Street also possesses a letter from Clara Morris, the actress, in which she denies any identification of the tintype as Booth and any belief in Mr. Bates' story.

The last chapter of Mr. Bates' book is devoted to the "identification" of the tintype by Junius Brutus Booth, the nephew of John Wilkes, *but born January 6, 1868, three years after the assassination*, and who had never seen his uncle John Wilkes Booth. Quoting from Mr. Bates: "While Mr. Junius Brutus Booth was in the city of Memphis, playing an engagement at the Lyceum Theater in support of Mrs. Brune, I sought an introduction to him, and by pre-arrangement was accorded an interview at my office, which lasted for several hours, being of much interest to myself as well as Mr. Booth. At this meeting, because of my former meeting and friendship for and close association with John St. Helen, I was enabled to recount to him much of the private history of the Booth family, which was enjoyed by Mr. Booth with an interest equaled only by his astonishment."—Then follows the usual affidavit.

> Memphis, Tenn.
> 2-21-03.
>
> "(F. L. Bates) I hand you Mr. Junius Brutus Booth, a tintype picture which was taken at Glenrose Mills, Hood County, Texas, on or about June, 1877, and handed to me by one John St. Helen, as a means of at some future time of identifying John Wilkes Booth. Will you kindly examine this picture, and in your own way identify the same."
>
> "I, Junius Brutus Booth, of the City of Boston, Massachusetts, recognize the likeness of John Wilkes Booth, not only in comparison with other photographs and pictures of said John Wilkes Booth, but I can also trace a strong family resemblance and a likeness to different members of my family, in the said tintype.
>
> "I am the eldest son of John Wilkes' brother, Junius Brutus Booth, born in Boston, January 6th, 1868. Those now living having any direct relation to John Wilkes Booth are, first, myself and my brother Sydney Booth, 16 Gramercy Park, New York. Creston Clarke, 16 Gramercy Park, New York; Wilfred Clark, New York; Dollie Clark Morgan, Vendome Hotel, New York; Adrienne Clark, Brighton, England, children of Asia Booth, sister of John Wilkes; Marion Booth daughter of Junius Brutus Booth, said John Wilkes' brother, also being my half-sister, New York.
>
> "The family of John Wilkes Booth's father, Junius Brutus Booth (the elder) and his wife, Mary Booth, consisted of my father Junius Brutus, the eldest, Rosalie Booth, Asia Booth, Edwin Thomas Booth and Joseph Adrian Booth. Subsequent or prior to my father's birth there was another son, who died in infancy.
>
> "The Clarks mentioned would be connected with John Wilkes Booth by the marriage of his sister, Asia Booth to John Sleeper Clark.
>
> (Signed) "Junius Brutus Booth."

There is little doubt that the tintype of St. Helen has some resemblance to John Wilkes Booth. This resemblance was aptly put by a Leadville, Colorado, undertaker when shown the tintype by the writer in January, 1921, "Yes, I recognize that picture. I buried a hundred fellows here that looked very much like that back in the early days."

The proofs of identification of the man shot in the Garrett barn and the true story of the disposal of John Wilkes Booth's body will be given in the next issue.

Douglas Fairbanks' "Straight Talk"

Concluded from page 5

glitter on the first page of my album if you honor me with your photo."

Right under the Antwerp letter was one from Scaffchandel, Finland, written by an enthusiastic male admirer. "I am very fond of you," it said. "All here in Finland love you very much and I also." Next came a poorly written note from Newark, New Jersey, on cheap ruled paper with a signature indicating either Spanish or Italian nationality. The burden of the letter was, "I like the way you act in such pictures as the Thief of Bagdad. I would like your photograph of a thief." The fourth letter was on expensively printed stationery from Mayaguez, Porto Rico. Then came one from Belmont avenue, New York City, written on a post card in pencil and signed, "Your friend."

The interest in these letters did not lie in any extraordinary feature, for they were not extraordinary so far as their wording was concerned. But the remarkable fact is that in the course of a year hundreds of thousands of honest folk are moved by this universal recreation which we call "pictures" to sit down and write their praise and gratitude to those who have stirred their hearts. Here in this voluminous correspondence one catches glimpses of the humor and pathos which make up the lives of all civilized peoples. And though these letter writers, regardless of education or social standing, understand little about the technique of making pictures, they do know when a production rings true.

There is this very important point regarding the production of high-standard pictures which every person interested in the cinema must bear in mind. The critics and the censors are, after all, on the side lines. They can criticize and praise with impunity. But for the artists and producers with ideals the problem of creating pictures that the people want becomes a tremendously serious, chance-taking proposition.

In these days when we are satiated with super-productions how thoughtlessly we praise or condemn. How few people realized that Douglas Fairbanks scraped together every dollar that he had made in all his previous productions until he had a million or more of liquid resources and then with wonderful nerve and courage literally "gambled" it in the greatest production of his life, up to that time—"The Thief of Bagdad!"

The people who are producing the big, clean, popular pictures of today are far bigger people than we realize. They are staking their own judgment, their faith in their own ideas and ideals against the highly organized, fabulously financed efforts of those with lower ideals, believing that the public will eventually disown the cheap, the tawdry, the sensational in pictures. No one who has not viewed this gigantic struggle at close range can appreciate all that is at stake. On the one hand are sordid-minded, cynically thinking interests who believe they can seize popularity by no less an expedient than bold appeal to the lower instincts and tastes. And, considering the thoughtless following which these interests obtain, is it any wonder that many have despaired of pictures?

On the other hand, there are those higher-minded people in pictures who firmly believe the group I have just mentioned is wrong. Do not suppose that these people who are laboring to produce better pictures are in this business for their health or for the moral glory that may come to them after they are gone. Rather, they have an unfaltering belief in the principle which Lincoln's oft-quoted phrase so aptly expresses: "You can fool some of the people all the time and all of the people some of the time, but you cannot fool all of the people all the time." In a word, these producers and actors who are turning out better pictures believe that they have the better ideals, the better understanding of the thoughts of mankind, the truer appreciation of the inherent decency and aspiration of the human heart.

The unmatched popularity of Douglas Fairbanks and his universally adored wife make this man the logical spokesman of the "better pictures" interests. When one views with misgivings some of the film plays ostensibly produced in response to a popular demand, it is reassuring and stimulating to have gained the point of view of an actor like Doug. His words are worth remembering—"When you are producing for the screen you can't camouflage, you can't cover up, you can't hide your own character. Pictures will reveal, sooner or later, the true character of those who share in their production."

The pictures that the people want are those made by clean-minded, broad-minded, keen-minded people. Good pictures, crowded down by a flood of cheap, frothy films, will rise again—if they have the yeast to make them rise!

New England Beaches in Summer

Concluded from page 6

What a vast picnic ground the beaches constitute! Some have especial novelties in this line connected with them, and our young people—yes, and the older and *old* ones, too—are more and more yielding to the lure of the open; and the picnic, instead of being a novelty, is the taken-for-granted in "vacation time" in the country or at the sea. "Weenie Roasts" are a specialty at one beach I know. Of course, all beach picnics infer a big driftwood fire, and the common or garden sausage is roasted over the coals—on a long pointed stick, mind you—and slipped into a crisp buttered roll with a bit of mustard and a tiny pickle to neighbor it, if one wishes this tangy stimulus to appetite. But, bless us! We need no "appetizers" at the beach! The air of the sea is the best appetizer there is; and the only fear in the mind of Slim Miss Picnicker is that she may be tempted to consume too many of those dreadful calories! "Bacon Bats" (there's much in a picturesque name) are another popular form of picnicking at the New England beaches. The bacon, in super-liberal amount, is fried in a long-handled frying pan (or "spider," as we New Englanders call it!) over a corner of the fire that has been allowed to burn to coals, or perhaps over a supplementary little stone oven constructed and maintained with picnicking in mind, and, when crisp and browned, made into the most delectable sandwiches with golden slices of toast that the girls have been making meantime. Long slender sticks with sharpened forked prongs make ideal toasting forks; and do all picnickers know that bacon needn't be laboriously pulled apart, slice by slice, before frying, but may be dumped all at once into the big hot pan, when it will melt apart all in a minute and will begin to curl and brown immediately as you toss and turn it? Also, that slices of bread are simply delicious fried in some of the left-over bacon fat? Plenty of stuffed eggs and an easily transportable "hearty" salad also go well at "Bacon Bats." Hot coffee, too; don't forget that! A dip in the ocean if weather allows and bath houses are available is, of course, the best and most enjoyable "first course" at either of the above festivities. After supper, toasted marshmallows—as many as your patience will allow—with stories, stunts, or a good "sing" in the moonlight—for real evening beach parties prefer a moon or a long, beautiful twilight, with a belated moonrise just before the party starts home.

With the picturesque—and comforting—driftwood fire to temper the sharp sea air, beach parties, day or evening, may be enjoyed in fine weather in early spring and well into late autumn. There is, however, a particularly delightful sort of late picnic made possible by the cosy, warm, glittering sand dunes that form an enchanting background to the New England sea beaches. Here, carved out by the strong, sweeping sea winds, are numberless little bays and inlets in the bright, shifting sand banks topped with the coarse strong beach grass, where one can find warm, sunny, sheltered corners formed by the protecting walls of the dunes, in which one may enjoy a midday picnic lunch with comfort, even on a cold winter day, with the hot sun beating down and the sheltering sand warmed by the stored-up heat. Such a picnic is a gift snatched from Fate—the last call of the picnic season.

I must add just a last word as to the flora of the New England beaches—so varied and beautiful as to delight one botanically inclined, or one who, without scientific knowledge, loves flowers as flowers and not as specimens. I know no part of the country where things "green and growing" flourish with such luxuriance as at the seashore, where the salt air and moisture seem to afford ideal conditions for their growth and development. Wild roses are never seen in such profusion or such deep, glowing beauty as at the seashore. I have in mind an extensive hedge of native roses at Little Boar's Head which is a constant delight through the entire season—as the "hips" are almost as lovely as the flowers. Various dainty wild orchids lose their shyness and their tendency to keep to the secret places and become communistic and flourish and increase. The violet-like fragrance of the pogonia fills the air, the calopogon pinks the meadows, and later the fireweed, the blazing star, the most wonderful beach goldenrod—like no other goldenrod that ever grows—and the countless varieties of the Michaelmas daisies paint a picture that, to those who love flowers, is a never-ending source of delight and, once seen, is never forgotten.

A Boston Fraud

By M. L. HAYWARD

"PLEASE send me by registered mail $10,000 worth of Liberty 3½s at the market," the Boston customer wrote, signed his name "M. E. Allman," and gave his address as 455 Columbus Avenue.

The New York broker looked up "M. E. Allman" in the commerical reports, failed to find his address, but did find that he was rated "good," sent the bonds by express, notified the customer, and inclosed the bill.

The day the bonds reached Boston, a young, efficient-looking clerk sauntered into the express office.

"Got a package here for M. E. Allman?" the caller queried.

The clerk in charge assured him that there was.

"Well, here's an order from him to deliver it to me."

The clerk saw that the order was signed "M. E. Allman," delivered the bonds, and the broker never saw them, nor the price thereof, investigated, found that 455 Columbus Avenue was a hotel with no "M. E. Allman" on the register—and sued the express company.

"You had no right to deliver the parcel to the first Tom, Dick, or Jerry that came along," the broker argued before the Massachusetts Supreme Court.

"You sent the bonds to a certain M. E. Allman that you had in your mind and intended him to have 'em, we delivered the bonds to the party that Allman authorized to receive them, and that lets us out," the insurance company retorted, and the court so ruled.

Another Shake-up in the Foreign Service

By BURT M. M'CONNELL

SHAKE-UPS in our diplomatic and consular services are not new; they used to follow every change in the administration at Washington. There was seldom anything beneficial or constructive about the old-fashioned house cleaning; an inexperienced person of one political belief merely succeeded an inexperienced person of another political belief. Among those "higher up," such as ambassadors and ministers to foreign countries, it was the practice among both major political parties to make diplomatic appointments political patronage. The highest ranking envoys were chosen from among the friends of the President-elect—particularly if they had been generous contributors to the campaign fund. They had other qualifications, of course, and they conducted our foreign affairs with considerable credit to themselves and to their country, but the knowledge that they might be displaced within two or three years had an injurious effect upon their morale, just as it affected the prestige and influence of the United States in world affairs. It also prevented qualified young men from taking up diplomacy as a profession, although that custom prevailed in practically every other country in the world.

In less than a year all this has been changed. Astounding as the statement may seem, President Coolidge has gone outside the diplomatic and consular service for only one appointee for an important post, and that within the last month.

The stabilization of the foreign service, by taking it out of politics, began last July with the passage of the Rogers Bill, which provided for the reorganization and reclassification of the diplomatic and consular services, their elimination as separate entities, and the creation in their stead of the foreign service. It confirmed the principle of promotion on merit. This bill made it possible, by supplementing the salaries of diplomatic representatives, for men without private fortunes to enter the service. It fixed the minimum salary at $3,000 and the maximum salary, with the exception of a few consuls general, at $9,000. It provided allowances for those retired at the age of 65 years.

Then the house cleaning began. "Weed out the deadwood," was the order that went forth. A reclassification from top to bottom was announced. Sixty names were immediately dropped from the permanent roll of the services. One diplomatic and thirty-one consular officials, having reached the new age limit, were retired. Eight diplomatic and thirteen consular officials were demoted because they had failed in certain designated tests to reach the desired standard of efficiency. Two resigned. It was the greatest mid-administration foreign service shake-up that had ever been seen. But it placed the foreign service on a business basis. This, of course, does not bind the next administration, whether it be Republican or Democratic, but it establishes a precedent which is likely to become a habit, until we shall be represented abroad by men of training and experience, as other countries are. From time to time, even in the Coolidge Administration, there undoubtedly will be important appointments from private life, but whenever possible preference will be given to persons already in the service, who regard their work as a permanent career.

President Coolidge's promotion, less than a month ago, of several high-ranking diplomatic officials, calls attention to the rapid progress made in reorganizing the foreign service. The selections were made upon the basis of merit and experience. The Minister to Rumania, who has been in the diplomatic service since 1902, was appointed Ambassador to Argentina. The Minister to Albania was promoted to become the Minister of Uruguay. Similar promotions previously were made affecting the present representatives at Rome, Brussels, and Rio de Janiero. The ministers to Persia, Honduras, and Nicaragua were promoted from the lower diplomatic grades. Such promotions helped increase the efficiency of the service and counteract the demoralizing influence of appointments made merely to reward political usefulness.

The recent appointment of Dr. Jacob Gould Schurman, American Minister at Pekin, is probably the outstanding example of the new policy. After nearly twenty-eight years as president of Cornell University, Dr. Schurman resigned because he felt that no one should retain such a position more than a quarter of a century, and was appointed Minister to China. As a reward for the important services he has rendered, Dr. Schurman is promoted to become Ambassador to Germany. He is one of the best educated men in the world today—and this ought to count for much in Germany. He will succeed Ambassador Houghton, who was promoted to the Court of St. James, at London, to fill the place left by Ambassador Kellogg when he became Secretary of State.

Dr. Schurman, handicapped by civil strife in China, handled a difficult situation well. He is still needed at Pekin, as the situation in China is very complex. But it is easier to find a suitable envoy to Pekin than to select an Ambassador to Germany, where there are great opportunities to promote friendship and commerce between Germany and the United States.

Once in Berlin, the new ambassador will find among his most important duties that of reknitting the fabric of trade between Germany and the United States, which was destroyed by the war, under the treaty recently ratified by the Senate and now before the German Reichstag for ratification. He knows the German language well, and is acquainted with German manners, habits, and customs. He is an ideal man for the post. The American people who view the past attitude of Japan toward China, and the restored relations of Japan and the Russian government, however, pray that his successor at Pekin will be as cultured, diplomatic, and firm. For on these attributes of our envoy to China may depend the future peace of the Pacific, if not of the whole world.

BRIEFLY TOLD

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. The set includes: "The International Jew," Vol. I, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

Within two blocks of Times Square, New York City, there are 12,357 eating places.

There are 21 living sons of Presidents of the United States.

For a year, Dr. William Hawes, founder of the Royal Humane Society of London in 1774 for the purpose of rendering "First Aid" in cases of drowning, offered a reward out of his own pocket to anyone bringing a body rescued from the water within a reasonable time of immersion.

So far as science can detect, there are no direct descendants of the primitive cave men who roamed Europe from 50,000 to 25,000 B. C.

Frederick W. Taylor, the efficiency expert, always shielded his wife from worry, at one time even going so far in the testing of a new saddle horse as to wear one of her borrowed skirts and ride in a side saddle that she would use.

A cemetery for noble horses in which lie buried ten regal, history-making rulers of the turf has been established by John E. Madden at Lexington, Kentucky, in the hope that this may be the "Westminster Abbey" for great horses.

A baby crying continuously for a day and a night would develop enough energy to lift himself to the top of Washington Monument.

An unsolved cross-word puzzle called the Phaestus, more than 2,000 years old, is now in Johns Hopkins Museum at Baltimore.

The year A. D. 3, on the occasion of the funeral of the Mikado, is assigned as the date of the abolition of human sacrifice in Japan.

Rats fed on hothouse-grown tomatoes will develop scurvy while those fed on tomatoes grown outside in direct sunlight do not.

A winery in California has 2,500,000 gallons of dry and sweet wines aging in casks awaiting a change in the dry law.

Trains passing through Kansas may now toot the regular Whooo, whooo, wooo-wooo, the same as in other states, the statute calling for three instead of four blasts being recently revised.

For more than two years the sun's heat at the tropics has been from one to two per cent below normal, but at present it is up to normal again.

A radiator cap painted with a combination containing metallic iodides that will change color at least fifty times with heating and cooling of the engine has been invented.

What is believed to be the first observatory for avalanches has been erected in the province of Stiermark by the Austrian State Government.

Theta was sometimes called the unlucky letter because it was used by the judges in passing condemnation on a prisoner, it being the first letter of the Greek word, "death."

In the seventh century, Omar, declaring that the Koran contained all that man should know, destroyed the great library of Alexandria, and used the books as fuel in the public baths.

The legal length of a beard in India during the time of Mahomet was fixed at 7 to 8 inches.

Nearly 32,000,000 copies of daily papers are printed for every week day in the year.

The last January eclipse of the sun is the first total eclipse to be seen in the British Isles since 1724.

The most distant object known to science is the Great Nebula of Andromeda, which is some 6,000,000,000,000,000,000 miles away.

When the protozoa which inhabit the digestive tract of white ants and digest their woody food for them are killed, the ants starve to death.

The sale of patent medicines in the United States last year exceeded $160,000,000.

It takes from 300 to 600 pounds of water passing through plants to produce a single pound of dry matter.

If a good forty-acre farm in America were as highly populated as some farms of China, it would support 240 persons, 24 donkeys, and 24 pigs, according to the late Dr. F. H. King.

China's silk industry was developed from the domestication of the wild insect and has lived for more than 4,000 years.

"He who can live without manual labor," says an old heraldic authority, "or can support himself as a gentleman without interfering in any mechanic employment, is called Mr. and may write himself Gentleman."

Reindeer milk is delivered in Alaska in the form of frozen cubes equal to a quart or pint.

Between 4,000,000 and 4,500,000 snakes are used annually in Japan for medicinal purposes. More than 200 men make their living by serpent catching in the vicinity of Mount Iouki and Shiga-Ken.

Knut Hamsun, Nobel prize winner, nearly starved to death before he got a steady job driving Chicago street cars.

Rev. Hugh Leith of Wilhinsburg, Pennsylvania, has received a letter from the Transvaal, South Africa, in which the writer told of enjoying the Thanksgiving service in Dr. Leith's church, although 10,000 miles away, through a receiver of his own construction.

More than 30 per cent of the paupers in American almshouses are over seventy years of age.

Half of the Irish immigrants to the United States came before 1867 while half of the Italian immigration has come since 1906.

CHRONICLER OF THE NEGLECTED TRUTH

"I Read in the Papers—"

I read in the papers that the British, last year, ate seven times as much mutton *per capita* as did the people of the United States and that our Department of Agriculture is "baffled in its attempt to find a satisfactory explanation therefor." Our department is apparently better at being baffled than it is at making an intelligent investigation. The truth is that British mutton is much more than seven times better than American mutton. It is better because in England they breed and raise sheep to eat, while in America sheep are primarily bred and raised to produce wool. A sheep's job in England is to produce meat that is good to eat; any wool that comes off its back is incidental. For centuries, English sheep growers have kept a steady eye to the propagation of the kinds of sheep that produced the best and the most meat. English sheep are of enormous size in comparison with the kind that are raised in America. American mutton too often tastes about as wool smells, but English mutton is a thing to get excited about when one is hungry. The only "baffling" fact about the figures quoted is that we are able to get down a seventh as much of our woolly mutton as the English do of their kind.

I read in the papers that the director of accounts of the state taxation department has just declared that there is $52,000 less than a nickle in the Revere city cash drawer and $249,000 of bills either due or soon to mature. When local politicians appealed to the Massachusetts legislature to waive the debt limit, that Revere might obtain money with which to pay its bills, the state director of accounts intimated that the situation was rather one for investigation by the district attorney. The state director of accounts declared that part of the $249,000 of Revere's unpaid bills was dated ahead and that the dealers who broke the law should be made to suffer as much as the luckless taxpayers who are already frightfully overburdened. It would be an illuminating and refreshing thing if grand juries in many counties throughout the country could be composed of fearless, competent men who would probe into the festering municipal troubles arising from the wanton spending habits of politicians. Revere is obtaining notoriety merely because her politicians have been caught in a spending orgy that doubtless is being duplicated in scores of other communities.

I read in the papers that Michael Joe O'Brien recently presented, on behalf of the Irish Historical Society, a new candidate for Columbia University's Hall of Fame. The candidate is one Hercules Mulligan, who organized the Sons of Liberty. On July 9, 1776, he, with John Sears, led an attack on the statue of the King in Bowling Green; they tore down the image and made the metal into bullets. He was a friend and confidant of Hamilton and Washington, and gave the latter important information which it is said enabled him to outwit Sir Henry Clinton. Here is a citizen of considerable account who has apparently been completely overlooked by the historians. How many more are there? Scores, beyond a doubt. Perhaps hundreds. They played their parts well, and in many cases their parts were of importance. But somehow or other—because they were neglected by the press, it may be—they were allowed to be forgotten. Let historians search the records of Revolutionary times anew, to see if they have not, in accepting the present system of historic emphasis, overlooked many another candidate for our gratitude as worthy as Hercules Mulligan.

I read in the papers about "war to end war." "War to end war, forsooth. Why, that is exactly as if we were to sally forth on a crusade to end whisky by drinking dry all the distilleries. We should only aggravate an inherited taste, and the distillers would soon get busy again to satisfy it." These are the words of Sir Ian Hamilton, a British veteran of many wars, winner of the Victoria Cross, and a military leader of proved ability. Like the late Lord "Bobs," under whom he fought, he is a believer in preparedness for war, but a staunch advocate of peace. He has no faith, however, in the theory that evil can be overcome by evil, or that fighting the devil with fire will transform the Prince of Darkness into a good angel. This is not only good logic, but it is sound common sense. The only "war to end war" which is worth while is that which wars to make war impossible. All nations are potential belligerents, and some are very much like a sun-parched forest, ready at any moment to burst into flame. There is no country that can afford to be indifferent to a possible outbreak of hostilities, no matter how piously it may wish for a lasting peace. Ideals are good, but facts cannot be ignored.

I read in the papers how last month a Brooklyn manufacturing concern went to the wall with liabilities of $310,000 and assets of only $150,000, a victim of high fees, extra bonuses and heavy interest. At the hearing it developed that there are today many lending concerns actually receiving from 20 to 25 per cent interest for their loans. In this instance the company paid $14,000 for a loan of $95,000. Many other companies are held up and "shaken down," for large sums through the machinations of money-lenders, who, with true Shylock characteristics, demand their pound of flesh. Unless the company subject to the mulcting is exceptionally strong, it goes under and its assets are distributed among the human jackals always waiting for such easy picking. Section 374 of Chapter XXV of the General Business Law provides that "no corporation shall interpose the defense of usury in any action." This renders helpless the borrowing corporation, and makes possible the legalized larceny practiced on unsuspecting firms by the heartless loan sharks.
